

UEDA THEORY FOR COMPACT CURVES WITH NODES

TAKAYUKI KOIKE

ABSTRACT. Let C be a compact complex curve included in a non-singular complex surface such that the normal bundle is topologically trivial. Ueda studied complex analytic properties of a neighborhood of C when C is non-singular or is a rational curve with a node. We propose an analogue of Ueda's theory for the case where C admits nodes. As an application, we study singular Hermitian metrics with semi-positive curvature on the anti-canonical bundle of the blow-up of the projective plane at nine points in arbitrary position.

1. INTRODUCTION

Let X be a non-singular complex surface and $C \subset X$ be a compact complex curve. Our aim is to investigate complex analytic properties of a neighborhood of C when the normal bundle $N_{C/X} := j^* \mathcal{O}_X(C)$ is topologically trivial, where we denote by j the inclusion $C \hookrightarrow X$. In the present paper, we treat the case where C is a curve with only nodes (i.e. C is a 1-dimensional reduced subvariety of X with only normal crossing singularities. C may be reducible, and may have a self-intersecting curve as an irreducible component). One main conclusion of our results in this paper is on the (non-)existence of C^∞ Hermitian metrics with semi-positive curvature on the line bundle $\mathcal{O}_X(C)$ when C is a cycle of rational curves:

THEOREM 1.1. *Let X be a non-singular complex surface and $C \subset X$ be a cycle of rational curves with topologically trivial normal bundle (C is a reduced subvariety of X with only nodes, and may be either a non-singular one or a rational curve with a node).*

(i) Assume that $N_{C/X}$ is a flat line bundle (i.e. it can be regarded as an element of $H^1(C, U(1))$, where $U(1) := \{z \in \mathbb{C} \mid |z| = 1\}$) with $\log d(\mathcal{O}_C, N_{C/X}^n) = O(\log n)$ as $n \rightarrow \infty$, where d is the Euclidean distance of $H^1(C, U(1))$. Then $\mathcal{O}_X(C)$ admits a C^∞ Hermitian metric with semi-positive curvature.

(ii) Assume that $N_{C/X}$ is not flat. Then the singular Hermitian metric $|f|^{-2}$ has the mildest singularities among singular Hermitian metrics of $\mathcal{O}_X(C)$ whose local weights are psh (plurisubharmonic), where $f \in H^0(X, \mathcal{O}_X(C))$ is a section whose zero divisor is C . Epecially, $\mathcal{O}_X(C)$ is nef, however it admits no C^∞ Hermitian metric with semi-positive curvature.

Key words and phrases. Flat line bundles, Ueda's theory, the blow-up of the projective plane at nine points.

Note that $H^1(C, U(1))$ can be regarded as a subset of $H^1(C, \mathcal{O}_C^*)$, which is the set of all holomorphic line bundles on C (see Remark 2.3). We can apply Theorem 1.1 to the anti-canonical bundle K_X^{-1} of the blow-up X of the projective plane $\mathbb{P}^2$ at nine points different from each other. Let $C_0 \subset \mathbb{P}^2$ be a compact curve of degree 3 including all of the nine points. Denote by C the strict transform of C_0 . When C_0 is a non-singular elliptic curve, it is known that $K_X^{-1} = \mathcal{O}_X(C)$ admits a C^∞ Hermitian metric with semi-positive curvature if $N_{C/X}$ is a torsion element of $H^1(C, \mathcal{O}_C^*)$ or satisfies the condition as in Theorem 1.1 (i) (It follows from [U83, Theorem 3], see [Br]). It follows from Theorem 1.1 (i) that the same phenomenon occurs even when C_0 is a curve with nodes if $N_{C/X}$ is topologically trivial. Thus, even in this case, we can pose the same question as the following Question 1.2, which the author learned from Prof. Jean-Pierre Demailly.

QUESTION 1.2. Let $C_0 \subset \mathbb{P}^2$ be a non-singular elliptic curve. Is there a configuration of nine points $\{p_j\}_{j=1}^9 \subset C_0$ such that the anti-canonical bundle K_X^{-1} of the blow-up X of $\mathbb{P}^2$ at $\{p_j\}_{j=1}^9$ admits no C^∞ Hermitian metric with semi-positive curvature?

Theorem 1.1 (ii) deduces the following:

COROLLARY 1.3. *There exists a configuration of nine points $\{p_j\}_{j=1}^9 \subset \mathbb{P}^2$ such that the anti-canonical bundle K_X^{-1} of the blow-up X of $\mathbb{P}^2$ at $\{p_j\}_{j=1}^9$ is nef, however it admits no C^∞ Hermitian metric with semi-positive curvature.*

Note that, though Corollary 1.3 gives an answer to a weak analogue of Question 1.2, we can not give an answer to the original form of Question 1.2 from Theorem 1.1 (ii). It is because $N_{C/X}$ is always flat if C_0 is non-singular, where C is the strict transform of C_0 (see [U83, Proposition 1]). We also study (singular) Hermitian metrics with semi-positive curvature on K_X^{-1} for arbitrary position of nine points (Theorem 7.1).

The goal of the present paper is to pose an analogue of Ueda theory ([U83], [U91]) for a curve C with only nodes included in a non-singular surface X . Prof. Tetsuo Ueda investigated complex analytic properties of a neighborhood of C when $N_{C/X}$ is topologically trivial in the case where C is non-singular ([U83]) and the case where C is a rational curve with a node ([U91]). When C is a curve with nodes, we define the “type” of the pair (C, X) as the supremum of the set of all integers n such that $u_\nu(C, X) = 0$ holds for all integer $\nu < n$, where $u_\nu(C, X) \in H^1(C, \mathcal{O}_C(N_{C/X}^{-\nu}))$ is the class we will define in §3 as an analogue of Ueda’s obstruction class posed in [U83]. Before describing our main results, we first explain our notations. We denote by $\mathcal{P}(C)$ the set of all topologically trivial holomorphic line bundles defined on C and by $\mathcal{P}_0(C)$ the set of all flat line bundles defined on C . We denote by $\mathcal{E}_0(C)$ the set of all torsion elements of $\mathcal{P}_0(C)$, and by $\mathcal{E}_1(C)$ the set of all elements L of $\mathcal{P}_0(C)$ which satisfies the condition $\log d(\mathcal{O}_C, L^n) = O(\log n)$ as $n \rightarrow \infty$, where d is an invariant distance of $\mathcal{P}_0(C)$ ($\mathcal{E}_1(C)$ does not depend on the choice of d , see [U83, §4.1]). For $L \in \mathcal{P}(C)$, we denote by $\mathbb{C}(L)$ the sheaf of constant sections of L . Note that the notion of the constant section is well-defined for $L \in \mathcal{P}(C)$, since L admit a flat connection (even when $L \notin \mathcal{P}_0(C)$, or equivalently, even when L admits no

flat metric, see Lemma 2.1). Note also that, the sheaf $\mathbb{C}(L)$ is independent of the choice of the flat connection up to sheaf isomorphism.

The main results of this paper are the follows. The first one is an analogue of [U83, Theorem 3]:

THEOREM 1.4. *Let X be a non-singular complex surface, C be a 1-dimensional reduced compact subvariety of X with only nodes such that $N_{C/X} \in \mathcal{E}_0(C) \cup \mathcal{E}_1(C)$. Assume that $i^*N_{C/X} \in \mathcal{E}_0(\tilde{C})$, where $i: \tilde{C} \rightarrow C$ is the normalization of C . Assume also that $H^1(C, \mathbb{C}(N_{C/X}^{-n})) = 0$ holds for each $n \in \mathbb{Z}_{>0}$. Then, if the pair (C, X) is of infinite type, then there exists a neighborhood V of C in X such that $\mathcal{O}_V(C)$ is flat.*

Next one is an analogue of [U83, Theorem 1, 2]:

THEOREM 1.5. *Let X be a non-singular complex surface, C be a 1-dimensional reduced compact subvariety of X with only nodes such that $G(C)$ is a tree and $N_{C/X} = \mathcal{O}_C$, where $G(C)$ is the dual graph of C ; i.e. $G(C)$ is the graph such that the vertex set of $G(C)$ is the set of all irreducible components of C and the edge set of $G(C)$ is the set of all nodal points of C . Assume that the type of the pair (C, X) is a finite number $n \in \mathbb{Z}_{>0}$. Assume also that $u_n(C, X)|_{C_\nu} \neq 0 \in H^1(C_\nu, \mathcal{O}_{C_\nu})$ holds for all irreducible component C_ν of C . Then the following holds:*

- (i) *For each real number $\lambda > 1$, There exists a neighborhood V of C and a strongly psh function $\Phi_\lambda: V \setminus C \rightarrow \mathbb{R}$ such that $\Phi_\lambda(p) \rightarrow \infty$ and $\Phi_\lambda(p) = O(d(p, C)^{-\lambda n})$ hold as $p \rightarrow C$, where $d(p, C)$ is the distance from p to C calculated by using a local Euclidean metric on a neighborhood of a point of C in V .*
- (ii) *Let V be a neighborhood of C in X , Ψ be a psh function defined on $V \setminus C$. If there exists a real number $0 < \lambda < 1$ such that $\Psi(p) = O(d(p, C)^{-\lambda n})$ as $p \rightarrow C$, then there exists a neighborhood V_0 of C in V such that $\Psi|_{V_0 \setminus C}$ is a constant function.*

The third one is an generalization of [U91, Theorem 1, 2]:

THEOREM 1.6. *Let X be a non-singular complex surface, C be a 1-dimensional reduced compact subvariety of X with only nodes such that the dual graph $G(C)$ is a cycle graph ($G(C)$ may be the graph with one vertex and one edge) and $N_{C/X} \in \mathcal{P}(C) \setminus \mathcal{P}_0(C)$. Assume that the type of the pair (C, X) is larger than or equal to 4. Then the following holds:*

- (i) *For each real number $\lambda > 1$, There exists a neighborhood V of C and a strongly psh function $\Phi_\lambda: V \setminus C \rightarrow \mathbb{R}$ such that $\Phi_\lambda(p) \rightarrow \infty$ and $\Phi(p) = O((- \log d(p, C))^{2\lambda})$ hold as $p \rightarrow C$, where $d(p, C)$ is the distance from p to C calculated by using a local Euclidean metric on a neighborhood of a point of C in V .*
- (ii) *Let V be a neighborhood of C in X , Ψ be a psh function defined on $V \setminus C$. If there exists a real number $0 < \lambda < 1$ such that $\Psi(p) = O((- \log d(p, C))^{2\lambda})$ as $p \rightarrow C$, then there exists a neighborhood V_0 of C in V such that $\Psi|_{V_0 \setminus C}$ is a constant function.*

[U83, Theorem 3] is shown by using L^∞ -norm estimates for 0-cochains whose coboundary define the obstruction class $u_\nu(C, X)$ for each ν . Refining this technique by considering

the exterior derivatives of such 0-cochains, we prove Theorem 1.4. [U83, Theorem 1, 2] and [U91, Theorem 1, 2] are shown by constructing a suitable function Φ_λ on a neighborhood of the curve for each $\lambda > 0$. We prove Theorem 1.5 and Theorem 1.6 by generalizing this construction.

The organization of the paper is as follows. In §2, we study fundamental properties of topologically trivial holomorphic line bundles on a curve with nodes. In §3, we give the definition of the obstruction class $u_n(C, X)$ and the type of the pair (C, X) . In §4, we prove Theorem 1.4. In §5, we prove Theorem 1.5. In §6, we prove Theorem 1.6. In §7, we prove Theorem 1.1. In this section, we also study singular Hermitian metrics with semi-positive curvature on the anti-canonical bundle of the blow-up of $\mathbb{P}^2$ at nine points in arbitrary position.

Acknowledgment. The author would like to give heartfelt thanks to Prof. Shigeharu Takayama whose comments and suggestions were of inestimable value for my study. He also thanks Prof. Tetsuo Ueda, Prof. Yoshinori Gongyo, and Dr. Yusuke Nakamura for helpful comments and warm encouragements. He is supported by the Grant-in-Aid for Scientific Research (KAKENHI No.25-2869) and the Grant-in-Aid for JSPS fellows.

2. TOPOLOGICALLY TRIVIAL HOLOMORPHIC LINE BUNDLES ON CURVES WITH NODES

In this section, we study fundamental properties of topologically trivial holomorphic line bundles on a curve with only nodes.

LEMMA 2.1. *Let C be a compact complex curve with only nodes and L be an element of $\mathcal{P}(C)$. Then, in a suitable local trivialization, all the transition functions of L are constant functions valued in $\mathbb{C}^*$: $\mathcal{P}(C) = \text{Image}(H^1(C, \mathbb{C}^*) \rightarrow H^1(C, \mathcal{O}_C^*))$. Especially it follows that L admits a flat connection even when $L \notin \mathcal{P}_0(C)$.*

PROOF. Considering the exponential short exact sequence, it is sufficient to show that the natural map $H^1(C, \mathbb{C}) \rightarrow H^1(C, \mathcal{O}_C)$ is surjective. For simplicity, we show this assertion only when the set C_{sing} of all singular points of C is a unit set $\{p\} \subset C$. Fix a sufficiently fine open covering $\{U_j\}_{j=1}^N$ of C . We may assume that $p \in U_j \implies j = 1$. Denote by $i: \tilde{C} \rightarrow C$ the normalizations of C and by $\{\tilde{U}_\nu\}_{\nu=0}^N$ the open covering of $\tilde{C}$ such that

$$i^{-1}(U_j) = \begin{cases} \tilde{U}_0 \sqcup \tilde{U}_1 & (j = 1) \\ \tilde{U}_j & (j > 1) \end{cases}$$

holds. Let $[(U_{jk}, f_{jk})]$ be an element of $H^1(C, \mathcal{O}_C)$ and set $\{(\tilde{U}_{jk}, \tilde{f}_{jk})\} := i^*\{(U_{jk}, f_{jk})\}$. Then $[(\tilde{U}_{jk}, \tilde{f}_{jk})]$ defines an element $[(\tilde{U}_{jk}, \tilde{f}_{jk})] \in H^1(\tilde{C}, \mathcal{O}_{\tilde{C}})$. Considering the Hodge decomposition on $\tilde{C}$, it turns out that $H^1(\tilde{C}, \mathbb{C}) \rightarrow H^1(\tilde{C}, \mathcal{O}_{\tilde{C}})$ is surjective and thus there exists a 0-cochain $\{(\tilde{U}_j, \tilde{F}_j)\}$ and an element $[(\tilde{U}_{jk}, \tilde{a}_{jk})] \in H^1(\tilde{C}, \mathbb{C})$ such that $\{(\tilde{U}_{jk}, \tilde{f}_{jk})\} = \{(\tilde{U}_{jk}, \tilde{a}_{jk})\} + \delta\{(\tilde{U}_j, \tilde{F}_j)\}$ holds.

Let us consider the case where $\tilde{F}_0(\tilde{p}_0) = \tilde{F}_1(\tilde{p}_1)$ holds, where $\{\tilde{p}_\ell\} = i^{-1}(p) \cap \tilde{U}_\ell$ for $\ell = 0, 1$. First, in this case, we will show that there exists a 0-cocycle $\{(U_j, F_j)\}$ such

that $i^*\{(U_j, F_j)\} = \{(\tilde{U}_j, \tilde{F}_j)\}$. As the construction of F_j for $j \neq 1$ is trivial, we only explain the construction of F_1 . Let us regard U_1 as a neighborhood of $(0, 0)$ in the subset $\{xy = 0\} \subset \mathbb{C}^2$, $\tilde{F}_0$ as a function $\tilde{F}_0(x)$ defined on $\tilde{U}_0 = (\text{a neighborhood of } (0, 0) \text{ in } \{y = 0\})$, and, $\tilde{F}_1$ as a function $\tilde{F}_1(y)$ defined on $\tilde{U}_1 = (\text{a neighborhood of } (0, 0) \text{ in } \{x = 0\})$. Then we can construct F_1 as the function $F_1(x, y) := \tilde{F}_0(x) + \tilde{F}_1(y) - \tilde{F}_0(0)$, which proves the assertion. By using this, we obtain that $[\{(U_{jk}, f_{jk})\}]$ and $[\{(U_{jk}, a_{jk})\}]$ coincide with each other as elements of $H^1(C, \mathcal{O}_C)$, where $\{(U_{jk}, a_{jk})\}$ is an element of $H^1(C, \mathbb{C})$ such that $i^*\{(U_{jk}, a_{jk})\} = \{(\tilde{U}_{jk}, \tilde{a}_{jk})\}$. This shows the lemma.

Next we consider the case where $A := \tilde{F}_1(\tilde{p}_1) - \tilde{F}_0(\tilde{p}_0) \neq 0$. From the same argument as in the previous case, we can construct a 0-cocycle $\{(U_j, F_j)\}$ such that $i^*\{(U_j, F_j)\} = \{(\tilde{U}_j, \tilde{F}_j + \delta_{j0} \cdot A)\}$ holds, where

$$\delta_{j0} := \begin{cases} 1 & (j = 0) \\ 0 & (\text{otherwise}). \end{cases}$$

Thus we can show that $\{(U_{jk}, f_{jk})\} - \delta\{(U_j, F_j)\} = \{(U_{jk}, a_{jk} + A_{jk})\}$ holds, where $\{(U_{jk}, a_{jk})\}$ and $\{(U_{jk}, A_{jk})\}$ are elements of $H^1(C, \mathbb{C})$ such that $i^*\{(U_{jk}, a_{jk})\} = \{(\tilde{U}_{jk}, \tilde{a}_{jk})\}$ and $i^*\{(U_{jk}, A_{jk})\} = \{(\tilde{U}_{jk}, \delta_{0j} \cdot A)\}$ holds. This shows the lemma. $\square$

REMARK 2.2. Let C be a compact curve with nodes and $i: \tilde{C} \rightarrow C$ be the normalization of C . Let $\{U_j\}$ be an open covering of C which is a finite collection of open sets. In the rest of this paper, we always assume that $\{U_j\}$ is fine enough to satisfy the following conditions: Each U_j is isomorphic to an open ball in $\mathbb{C}$ or a neighborhood of $(0, 0)$ in $\{xy = 0\} \subset \mathbb{C}^2$, and each U_{jk} is isomorphic to an open ball in $\mathbb{C}$. Moreover we may assume that, for each j, k such that $U_j \cap C_{\text{sing}} \neq \emptyset$ and $U_k \cap C_{\text{sing}} \neq \emptyset$, the intersection U_{jk} is the empty set. Let $\{\tilde{U}_\nu\}$ be an open covering of $\tilde{C}$ which satisfies the following conditions: For j such that $U_j \cap C_{\text{sing}} = \emptyset$, there exists ν such that $i^{-1}(U_j) = \tilde{U}_\nu$. For $U_k \cap C_{\text{sing}} \neq \emptyset$, there exists μ, λ such that $i^{-1}(U_k) = \tilde{U}_\mu \cup \tilde{U}_\lambda$. Moreover, each $\tilde{U}_\nu$ is isomorphic to an open ball in $\mathbb{C}$.

From the proof of Lemma 2.1, it turns out that, for each $L = [\{(U_{jk}, t_{jk})\}] \in H^1(C, \mathbb{C}^*)$, there exists $\tau_{\nu\mu} \in U(1)$ and $a_\nu \in \mathbb{C}^*$ such that $t_{jk} = \tau_{\nu\mu} \cdot a_\mu / a_\nu$ holds for each j, k, ν, μ with $i^{-1}(U_{jk}) = \tilde{U}_{\nu\mu}$. Moreover, we may assume that $a_\nu = 1$ holds for each ν such that $\tilde{U}_\nu = i^{-1}(U_j)$ for some U_j .

Consider the case where C is a rational curve with a node p . In this case, we may assume that $\tau_{\nu\mu} = 1$ for each ν and μ , and there uniquely exists an open set U_{k_0} such that $p \in U_{k_0}$. Then the number a_{k_0} or $a_{k_0}^{-1}$ coincides with the number α appears in [U91].

REMARK 2.3. Let C be a compact curve with nodes. Though the map $H^1(C, \mathbb{C}^*) \rightarrow H^1(C, \mathcal{O}_C^*)$ is not injective in general, the natural map $H^1(C, U(1)) \rightarrow H^1(C, \mathcal{O}_C^*)$ is injective. For proving this fact, it is sufficient to show that the natural map $H^1(C, \mathbb{R}) \rightarrow H^1(C, \mathcal{O}_C)$ is injective. Let $i: \tilde{C} \rightarrow C$ be the normalization and $\tilde{C} = \bigcup_{\nu=1}^N \tilde{C}_\nu$ be the irreducible decomposition. By considering the short exact sequences as in the proof of

Proposition 2.5 below, we obtain the following commutative diagram with exact rows:

$$\begin{array}{ccccccc}
\bigoplus_{\nu=1}^N \mathbb{R} & \longrightarrow & \bigoplus_{p_j \in C_{\text{sing}}} \mathbb{R} & \longrightarrow & H^1(C, \mathbb{R}) & \longrightarrow & \bigoplus_{\nu=1}^N H^1(\tilde{C}_\nu, \mathbb{R}) \\
\downarrow \alpha & & \downarrow \beta & & \downarrow & & \downarrow \gamma \\
\bigoplus_{\nu=1}^N \mathbb{C} & \longrightarrow & \bigoplus_{p_j \in C_{\text{sing}}} \mathbb{C} & \xrightarrow{\delta} & H^1(C, \mathcal{O}_C) & \longrightarrow & \bigoplus_{\nu=1}^N H^1(\tilde{C}_\nu, \mathcal{O}_{\tilde{C}_\nu}).
\end{array}$$

Taking an element ξ from the kernel of the map $H^1(C, \mathbb{R}) \rightarrow H^1(C, \mathcal{O}_C)$, we prove that $\xi = 0$ holds. It follows from the Hodge decomposition theorem that the map γ above is an isomorphism. Thus there exists an element $\eta \in \bigoplus_{p_j \in C_{\text{sing}}} \mathbb{R}$ such that $\eta \mapsto \xi$ holds. As $\delta(\beta(\eta)) = 0$, there exists an element $\zeta \in \bigoplus_{\nu=1}^N \mathbb{C}$ such that $\zeta \mapsto \beta(\eta)$. Since it holds that $\text{Re}(\zeta) \mapsto \eta$, we obtain that $\xi = 0$ holds.

LEMMA 2.4. *Let C be a compact curve with nodes. If the dual graph $G(C)$ of C is a tree, $\mathcal{P}_0(C) = \mathcal{P}(C)$ holds.*

PROOF. When the depth of $G(C)$ is equal to 0, lemma follows from [U83, §1.1]. It also turns out that, $\mathcal{P}_0(C) = \mathcal{P}(C)$ holds when there exist $C_1, C_2 \subset C$ such that $C = C_1 \cup C_2$, $\#(C_1 \cap C_2) = 1$, and $\mathcal{P}_0(C_j) = \mathcal{P}(C_j)$ holds for $j = 0, 1$. Thus we can show this lemma by the induction for the depth of $G(C)$. $\square$

PROPOSITION 2.5. *Let C be a compact complex curve with only nodes and L be an element of $\mathcal{P}(C)$. Assume one of the following conditions:*

- (1) *$G(C)$ is a tree and $L = \mathcal{O}_C$.*
- (2) *Euler number of $G(C)$ is equal to 0, $L \neq \mathcal{O}_C$, and $i^*L = \mathcal{O}_{\tilde{C}}$, where $i: \tilde{C} \rightarrow C$ is the normalization.*

Then the natural map $H^1(C, \mathbb{C}(L)) \rightarrow H^1(C, \mathcal{O}_C(L)) \oplus H^1(C, \overline{\mathcal{O}}_C(L))$ is isomorphism, where $\mathcal{O}_C(L), \overline{\mathcal{O}}_C(L)$ is the sheaf of holomorphic, anti-holomorphic sections of L , respectively.

PROOF. Denote by $\tilde{C} = \bigcup_{\nu=1}^N \tilde{C}_\nu$ the irreducible decomposition of $\tilde{C}$. Consider the short exact sequence $0 \rightarrow \mathbb{C}(L) \rightarrow i_*\mathbb{C}(i^*L) \rightarrow \bigoplus_{p \in C_{\text{sing}}} L|_p \rightarrow 0$, where $i_*\mathbb{C}(i^*L) \rightarrow \bigoplus_{p \in C_{\text{sing}}} L|_p$ is the map defined by $(i_*\mathbb{C}(i^*L))_p = L|_p \oplus L|_p \ni (a, b) \mapsto a - b \in L|_p$ for each $p \in C_{\text{sing}}$. This short exact sequence induces the exact sequence

$$\begin{aligned}
0 & \rightarrow H^0(C, \mathbb{C}(L)) \rightarrow \bigoplus_{\nu=1}^N H^0(\tilde{C}_\nu, \mathbb{C}(i^*L|_{\tilde{C}_\nu})) \rightarrow \bigoplus_{p \in C_{\text{sing}}} L|_p \\
& \rightarrow H^1(C, \mathbb{C}(L)) \rightarrow \bigoplus_{\nu=1}^N H^1(\tilde{C}_\nu, \mathbb{C}(i^*L|_{\tilde{C}_\nu})) \rightarrow 0.
\end{aligned}$$

As $i^*L|_{\tilde{C}_\nu} = \mathcal{O}_{\tilde{C}_\nu}$ holds for each ν under the assumptions (1), (2), we obtain the equation

$$\dim H^1(C, \mathbb{C}(L)) = \dim H^0(C, \mathbb{C}(L)) - N + \#(C_{\text{sing}}) + \sum_{\nu=1}^N \dim H^1(\tilde{C}_\nu, \mathbb{C}(i^*L|_{\tilde{C}_\nu})).$$

As $\dim H^0(C, \mathbb{C}(L)) - N + \#(C_{\text{sing}}) = 0$ holds under the assumptions (1), (2), we obtain $\dim H^1(C, \mathbb{C}(L)) = \sum_{\nu=1}^N \dim H^1(\tilde{C}_\nu, \mathbb{C}(i^*L|_{\tilde{C}_\nu}))$. We also obtain $\dim H^1(C, \mathcal{O}_C(L)) = \sum_{\nu=1}^N \dim H^1(\tilde{C}_\nu, \mathcal{O}_{\tilde{C}_\nu}(i^*L|_{\tilde{C}_\nu}))$ and $\dim H^1(C, \overline{\mathcal{O}}_C(L)) = \sum_{\nu=1}^N \dim H^1(\tilde{C}_\nu, \overline{\mathcal{O}}_{\tilde{C}_\nu}(i^*L|_{\tilde{C}_\nu}))$ from the same argument for the sheaves $\mathcal{O}_C(L)$ and $\overline{\mathcal{O}}_C(L)$ instead of $\mathbb{C}(L)$. Since each $\tilde{C}_\nu$ is a compact Kähler manifold, $\dim H^1(\tilde{C}_\nu, \mathbb{C}(i^*L|_{\tilde{C}_\nu})) = \dim H^1(\tilde{C}_\nu, \mathcal{O}_{\tilde{C}_\nu}(i^*L|_{\tilde{C}_\nu})) + \dim H^1(\tilde{C}_\nu, \overline{\mathcal{O}}_{\tilde{C}_\nu}(i^*L|_{\tilde{C}_\nu}))$ holds. Thus we obtain the equation

$$\dim H^1(C, \mathbb{C}(L)) = \dim H^1(C, \mathcal{O}_C(L)) + \dim H^1(C, \overline{\mathcal{O}}_C(L)).$$

By the same argument as in [U83, p. 586], we can show that the natural map $H^1(C, \mathbb{C}(L)) \rightarrow H^1(C, \mathcal{O}_C(L)) \oplus H^1(C, \overline{\mathcal{O}}_C(L))$ is injective. Thus this map is isomorphism. $\square$

3. DEFINITION OF THE OBSTRUCTION CLASSES AND THE TYPE FOR THE PAIR (C, X)

Let X be a compact non-singular complex surface and $C \subset X$ be a compact complex curve with only nodes. Assume that $N_{C/X} \in \mathcal{P}(C)$. In this section, we give the definition of the obstruction class $u_n(C, X) \in H^1(C, \mathcal{O}_C(N_{C/X}^{-n}))$ and the type of the pair (C, X) in almost the same manner as in the case where C is non-singular [U83]. Let us fix an open covering $\{U_j\}$ of C as in Remark 2.2. Fix a sufficiently small neighborhood V of C in X and an open covering $\{V_j\}$ of V such that $V_j \cap C = U_j$. We may assume that $V_{jk} \neq \emptyset$ only if $U_{jk} \neq \emptyset$.

LEMMA 3.1. *Let $t_{jk} \in \mathbb{C}^*$ be constants such that $N_{C/X} = [\{(U_{jk}, t_{jk})\}]$. Then, by shrinking V and $\{V_j\}$ if necessary, there exists a system $\{(V_j, w_j)\}$ of defining functions w_j of U_j on V_j such that $t_{jk}w_k = w_j + O(w_j^2)$ holds on V_{jk} for each j, k .*

PROOF. Fix a defining functions v_j of U_j on V_j for each j . Since $[\{(U_{jk}, (v_j/v_k)|_{U_{jk}})\}] = [\{(U_{jk}, t_{jk})\}] \in H^1(\{U_{jk}\}, \mathcal{O}_C^*)$, there exists 0-cochain $\{(U_j, e_j)\} \in \check{C}^0(\{U_j\}, \mathcal{O}_C^*)$ such that $(v_j/v_k)|_{U_{jk}} = t_{jk}e_j/e_k$. By shrinking V and $\{V_j\}$ if necessary, there exists a nowhere vanishing holomorphic function f_j on V_j such that $f_j|_{U_j} = e_j$ for each j . Then we can show the lemma by considering $w_j := f_j^{-1}v_j$. $\square$

Fix $\{t_{jk}\}, \{w_j\}$ as in Lemma 3.1. In the following, we always assume that $V_j \cap C_{\text{sing}} = \emptyset$ whenever we consider the set V_{jk} . Let

$$(3.1) \quad t_{jk}w_k = w_j + f_2^{kj}(z_j) \cdot w_j^2 + f_3^{kj}(z_j) \cdot w_j^3 + f_4^{kj}(z_j) \cdot w_j^4 + \cdots$$

be the expansion of $t_{jk}w_k$ by w_j on V_{jk} , where z_j is a holomorphic function defined on V_j such that (z_j, w_j) is a coordinates system of V_j .

DEFINITION 3.2. We say that the system $\{w_j\}$ is of **order** n if the coefficient f_m^{jk} in the expansion (3.1) is equal to 0 for all $m \leq n$ on each V_{jk} .

PROPOSITION 3.3. *Assume that a system $\{w_j\}$ is of order n . Then $\{(U_{jk}, f_{n+1}^{kj}|_{U_{jk}})\}$ satisfies the cocycle condition for $\mathcal{O}_X(-nC)|_C$, where f_{n+1}^{kj} is that in the expansion (3.1).*

PROOF. From a simple calculation, we obtain the equation

$$f_{n+1}^{kj}|_{U_{jk}} = \frac{1}{n}(w_j^{-n} - t_{jk}^{-n}w_k^{-n})|_{U_{jk}}$$

on each U_{jk} , which shows the 1-cocycle condition. $\square$

DEFINITION 3.4. We denote by $u_n(C, X)$ the class $[(U_{jk}, f_{n+1}^{kj}|_{U_{jk}})] \in H^1(C, \mathcal{O}_X(N_{C/X}^{-n}))$. We say that the obstruction class $u_n(C, X)$ is **well-defined** if, by shrinking V and $\{V_j\}$ if necessary, there exists a system $\{w_j\}$ of order n .

REMARK 3.5. It can be easily shown that the class $[u_n(C, X)] \in H^1(C, \mathcal{O}_X(N_{C/X}^{-n}))/\mathbb{C}^*$ does not depend on the choice of the system $\{w_j\}$ of order n .

PROPOSITION 3.6. Assume that $u_n(C, X)$ is well-defined. Then, for each $m < n$, $u_m(C, X)$ is also well-defined and $u_m(C, X) = 0$ holds. $u_n(C, X) = 0$ holds if and only if $u_{n+1}(C, X)$ is well-defined.

PROOF. The first assertion is clear by definition of $u_m(C, X)$. Thus we here show the second assertion. Assuming $u_n(C, X) = 0$, we will construct a new system $\{v_j\}$ of order $n+1$ by shrinking V and $\{V_j\}$ if necessary.

As $u_n(C, X) = 0$ holds, there exists a 0-cochain $\{(U_j, F_j)\} \in \check{C}^0(\{U_j\}, \mathcal{O}_C(N_{C/X}^{-n}))$ such that

$$F_j - t_{jk}^{-n}F_k = (w_j^{-n} - t_{jk}^{-n}w_k^{-n})|_{U_{jk}}$$

holds for each j, k . Extending each F_j to a holomorphic function defined on V_j by shrinking V and $\{V_j\}$ if necessary, we define a new system $\{v_j\}$ by $v_j := w_j \cdot (1 - F_j w_j^n)^{-\frac{1}{n}} = w_j + \frac{1}{n}F_j w_j^{n+1} + \dots$. Since $v_j = w_j + O(w_j^{n+1})$, it is clear that our new system $\{v_j\}$ is also of order n . Moreover, the equation

$$(v_j^{-n} - t_{jk}^{-n}v_k^{-n})|_{U_{jk}} = ((w_j - F_j)^{-n} - t_{jk}^{-n}(w_k^{-n} - F_k))|_{U_{jk}} \equiv 0$$

shows that the system $\{v_j\}$ is of order $n+1$ (see the proof of Proposition 3.3). $\square$

By Proposition 3.6, we can define the type of the pair (C, X) as follows:

DEFINITION 3.7. We say that (C, X) is of **type** $n \in \mathbb{Z}_{>0}$ if $u_n(C, X)$ is well-defined and $u_n(C, X) \neq 0$ holds. We say that (C, X) is of **infinite type** if $u_n(C, X)$ is well-defined and $u_n(C, X) = 0$ holds for all $n \in \mathbb{Z}_{>0}$.

4. PROOF OF THEOREM 1.4

4.1. **Preliminary for the proof of Theorem 1.4.** Let C be a compact complex curve with only nodes and $i: \tilde{C} \rightarrow C$ be the normalization. Fix an open covering $\{U_j\}$ of C and $\{\tilde{U}_\nu\}$ of $\tilde{C}$ as in Remark 2.2. In the proof of Theorem 1.4, as in [U83, p. 601], we use the function

$$d(\mathcal{O}_C, L) := \inf_{\{t_{jk}\}} \max_{j,k} |1 - t_{jk}|.$$

as a distance between $\mathcal{O}_C$ and $L \in \mathcal{P}_0(C)$, where the infimum is taken over the set of all $\{t_{jk}\} \subset U(1)$ such that $L = [\{(U_{jk}, t_{jk})\}] \in H^1(C, U(1))$. We use the following lemmata for proving the theorem:

LEMMA 4.1. *For each $L \in \mathcal{P}_0(C)$, there exists a constant $K = K(L) > 0$ such that the following holds: For each 1-cocycle $\alpha = \{(U_{jk}, \alpha_{jk})\} \in Z^1(\{U_j\}, \mathbb{C}(L))$ with $[\alpha] = 0 \in H^1(\{U_j\}, \mathbb{C}(L))$, There exists a 0-cochain $\beta = \{(U_j, \beta_j)\} \in \check{C}^0(\{U_j\}, \mathbb{C}(L))$ such that $\delta\beta = \alpha$ and $\|\beta\| \leq K\|\alpha\|$ holds, where $\|\alpha\| = \max_{jk} \sup_{U_{jk}} |\alpha_{jk}|$, $\|\beta\| = \max_j \sup_{U_j} |\beta_j|$.*

Lemma 4.1 can be shown in the same manner as the proof of [KS, Lemma 2]. Next lemma is an analogue of [U83, Lemma 4].

LEMMA 4.2. *There exists a constant $K = K(C) > 0$ such that, for each $L \in \mathcal{P}_0(C)$ and $\beta = \{(U_j, \beta_j)\} \in \check{C}^0(\{U_j\}, \mathbb{C}(L))$, $d(\mathcal{O}_C, L)\|\beta\| \leq K\|\delta\beta\|$ holds.* $\square$

PROOF. Let G be the dual graph of the open covering $\{U_j\}$: i.e. the vertex set is the set $\{U_j\}$, and there exist an edge connecting U_j and U_k if and only if $U_{jk} \neq \emptyset$. Denote by K_0 the length of a longest path of G . We will show the inequality $d(\mathcal{O}_C, L) \leq (1 + 2K_0)\|\delta\beta\|$ for each $L \in \mathcal{P}_0(C)$ and $\beta = \{(U_j, \beta_j)\}$ such that $\|\beta\| = 1$.

Fix j_0 such that $|\beta_{j_0}| = 1$. Then, for each U_j , there exists a path ℓ of G from U_{j_0} to U_j whose length is $n \leq K_0$. Let $U_{\ell_0}, U_{\ell_1}, \dots, U_{\ell_n}$ be the sequence of open sets corresponding to the path ℓ ($n \leq K$, $\ell_0 = j_0, \ell_n = j, U_{\ell_\nu} \cap U_{\ell_{\nu+1}} \neq \emptyset$ for each $\nu < n$). First, we will show that $1 - |\beta_{\ell_\nu}| \leq \nu\|\delta\beta\|$ holds for each $\nu \leq n$. As it is clear in the case $\nu = 0$, it is sufficient to show $1 - |\beta_{\ell_{\nu+1}}| \leq (\nu + 1)\|\delta\beta\|$ assuming that $1 - |\beta_{\ell_\nu}| \leq \nu\|\delta\beta\|$ holds. Since $|\beta_{\ell_\nu}| \leq |\beta_{\ell_{\nu+1}}| + |\beta_{\ell_{\nu+1}} - t_{\ell_{\nu+1}\ell_\nu}\beta_{\ell_\nu}| \leq |\beta_{\ell_{\nu+1}}| + \|\delta\beta\|$, the assertion holds.

Thus we obtain the inequality $1 - |\beta_j| \leq K_0\|\delta\beta\|$ for all j . Therefore

$$\begin{aligned} d(\mathcal{O}_C, L) &\leq \max_{j,k} \left| \frac{\beta_j}{|\beta_j|} - t_{jk} \frac{\beta_j}{|\beta_j|} \right| \\ &\leq \max_{j,k} \left(\left| \frac{\beta_j}{|\beta_j|} - \beta_j \right| + |\beta_j - t_{jk}\beta_k| + \left| \frac{\beta_j}{|\beta_j|} - \beta_k \right| \right) \\ &\leq \|\delta\beta\| + 2 \max_j (1 - |\beta_j|) \leq (1 + 2K_0)\|\delta\beta\| \end{aligned}$$

holds, which shows the lemma. $\square$

4.2. Proof of Theorem 1.4. Let V be a sufficiently small neighborhood of C in X . Fix an open covering $\{V_j\}$ of V such that $U_j = V_j \cap C$, where $\{U_j\}$ is that in the previous subsection. Fix also a defining function w_j of U_j in V_j as in Lemma 3.1. We will prove Theorem 1.4 by constructing a new system $\{(V_j, u_j)\}$ of defining functions u_j of U_j in V_j such that $t_{jk}u_k = u_j$ holds on each V_{jk} . Just as the proof of [U83, Theorem 3], we will construct such a new system $\{(V_j, u_j)\}$ by solving the functional equation

$$(4.1) \quad w_j = u_j + \sum_{n=2}^{\infty} F_n^j u_j^n$$

on each V_j after defining a suitable holomorphic function F_j on each V_j .

4.2.1. *Construction of $\{F_n^j\}$.* Fix a holomorphic function z_j defined on V_j such that (z_j, w_j) is a coordinates system of V_j for each j such that $V_j \cap C_{\text{sing}} = \emptyset$. In this subsection, we show the existence of $\{F_\nu^j\}$ such that the following **(Property) $_n$** holds for each integer $n \geq 2$:

(Property) $_n$: Each F_j depends only on the variable z_j if $V_j \cap C_{\text{sing}} = \emptyset$, and the system $\{(V_j, u_j)\}$ is of order n if u_j is a defining function of U_j in V_j which satisfies the equation $w_j = u_j + \sum_{\nu=2}^n F_\nu^j u_j^\nu$. $\square$

We show the existence of such $\{F_\nu^j\}$ by induction for n . Assuming that there exists a system $\{F_\nu^j\}$ for $\nu = 2, 3, \dots, n-1$ which satisfies **(Property) $_{n-1}$** , we will construct $\{F_n^j\}$ (The construction of $\{F_2^j\}$ is done in the same manner as follows).

Consider the expansion (3.1) of $t_{jk}w_k$ by w_j on V_{jk} :

$$t_{jk}w_k = w_j + f_2^{kj}(z_j) \cdot w_j^2 + f_3^{kj}(z_j) \cdot w_j^3 + f_4^{kj}(z_j) \cdot w_j^4 + \dots$$

(Recall that we are assuming that $V_j \cap C_{\text{sing}} = \emptyset$ whenever we consider the set V_{jk}). Let

$$(4.2) \quad F_\nu^k(w_j, z_j) = \pi_j^*(F_\nu^k|_{U_{jk}}) + \sum_{\lambda=1}^{\infty} F_{\nu\lambda}^{kj}(z_j) \cdot w_j^\lambda$$

be the expansion of F_ν^k by the variable w_j on V_{jk} , where $\pi_j: V_j \rightarrow U_j$ is the projection defined by $(w_j, z_j) \mapsto (0, z_j)$. Define the system $\{P_\nu^{kj}\}$ by

$$(4.3) \quad \sum_{\nu=2}^n f_\nu^{kj}(z_j) \cdot \left(w_j + \sum_{\lambda=2}^{n-1} F_\lambda^j(z_j) \cdot w_j^\lambda \right)^\nu = \sum_{\nu=2}^n P_\nu^{kj}(z_j) \cdot w_j^\nu + O(w_j^{n+1}),$$

and the system $\{Q_\nu^{kj}\}$ by

$$(4.4) \quad \sum_{\nu=2}^{n-1} t_{jk}^{-\nu+1} \sum_{\lambda=1}^{\infty} F_{\nu\lambda}^{kj}(z_j) \cdot \left(w_j + \sum_{\lambda=2}^{n-1} F_\lambda^j(z_j) \cdot w_j^\lambda \right)^\lambda \cdot w_j^\nu = \sum_{\nu=2}^n Q_\nu^{kj}(z_j) \cdot w_j^\nu + O(w_j^{n+1}).$$

Note that each P_ν^{kj} and Q_ν^{kj} is uniquely determined after determining $\{F_\mu^j\}$ for $\mu < \nu$. Calculations by using **(Property) $_{n-1}$** shows that the class of $H^1(C, \mathcal{O}_C(N_{C/X}^{-n+1}))$ defined by $(P_\nu^{kj} - t_{jk}^{-n+1} Q_\nu^{kj})|_{U_{jk}}$ coincides with the obstruction class $u_{n-1}(C, X)$ (see [U83, §4.2]). Since $u_{n-1}(C, X) = 0$, there exists a 0-cochain $\{(U_j, f_n^j)\}$ such that $f_n^j - t_{jk}^{-n+1} f_n^k = (P_\nu^{kj} - t_{jk}^{-n+1} Q_\nu^{kj})|_{U_{jk}}$ holds for each j, k . The calculation in [U83, §4.2] shows that a system $\{F_n^j\}$ satisfies **(Property) $_n$** if $F_n^j(w_j, z_j) = f_n^j(z_j)$ for each j such that $V_j \cap C_{\text{sing}} = \emptyset$, and $F_n^k|_{U_k} = f_n^k$ holds for each k . $\square$

4.2.2. *Construction of $\{u_j\}$.* In this subsection, we prove Theorem 1.4 assuming that there exists a system $\{F_n^j\}_{n=2}^\infty$ which satisfies **(Property) $_n$** for each $n \geq 2$ and the formal power series $X + \sum_{n=2}^\infty (\sup_{V_j} |F_n^j|) \cdot X^n$ has a positive radius of convergence (We will prove this assertion from the next subsection). For each j such that $U_j \cap C_{\text{sing}} = \emptyset$, we define u_j by the functional equation (4.1) (It is clear that there uniquely exists a solution of the functional equation (4.1)). Next, let us consider on U_k such that $U_k \cap C_{\text{sing}} = \emptyset$. Let (x_k, y_k) be a coordinates system of U_k such that $w_k = x_k \cdot y_k$. Define new coordinates

system $(\tilde{x}_k, \tilde{y}_k)$ of U_k by $\tilde{x}_k = x_k$ and $y_k = \tilde{y}_k + \sum_{n=2}^{\infty} F_n^k x_k^{n-1} \tilde{y}_k^n$. Then clearly the function $u_k := \tilde{x}_k \cdot \tilde{y}_k$ is a defining function of U_k in V_k and is a solution of the functional equation (4.1). From (Property) $_n$ for each $n \geq 2$, we can conclude that $t_{jk} u_k = u_j$ holds on each V_{jk} , which proves the theorem. $\square$

4.2.3. *Convergence of the functional equation (4.1) for the case $N_{C/X} \in \mathcal{E}_0(C)$.* In this subsection, we prove that the formal power series $X + \sum_{n=2}^{\infty} (\sup_{V_j} |F_n^j|) \cdot X^n$ has a positive radius of convergence for a suitable choice of $\{F_n^j\}$ when $N_{C/X} \in \mathcal{E}_0(C)$.

First, we fix a point $p_j \in U_j$ as follows: For each j such that $U_j \cap C_{\text{sing}} = \emptyset$, we can regard U_j as the ball $\{|z| < \varepsilon_j\} \subset \mathbb{C}$ for some positive number ε_j via the coordinate function z_j . For such j , we define p_j by $z_j(p_j) = 0 \in \{|z| < \varepsilon_j\}$. For each k such that $U_k \cap C_{\text{sing}} \neq \emptyset$, via a suitable coordinates system (x_k, y_k) of V_k , U_k is isomorphic to $\{x_k \cdot y_k = 0, |x_k| < \varepsilon_k, |y_k| < \varepsilon_k\} \subset \mathbb{C}^2$ for some positive number ε_k . For such k , we define p_k by $(x_k(p_k), y_k(p_k)) = (0, 0) \in \{x_k \cdot y_k = 0, |x_k| < \varepsilon_k, |y_k| < \varepsilon_k\}$. We denote by C_n^j the constant $F_n^j(p_j)$ for each j and n . Note that we may assume that $\varepsilon_j, \varepsilon_k < 1$. Fix an open covering $\{U_j^*\}$ of C such that $\overline{U_j^*} \subset U_j$ and $U_{jk} = \emptyset \Rightarrow U_{jk}^* = \emptyset$ holds for each j, k . Fix also an open neighborhood V_j^* of U_j^* in V_j such that $\overline{V_j^*} \subset V_j$. Note that, we may assume that the coordinate function $z_j(x_k, y_k)$ can be extended to the set $V_j \cup V_l^*$ ($V_k \cup V_l^*$) if $U_{jl} \neq \emptyset$ ($U_{kl} \neq \emptyset$, respectively), since $\{U_j\}$ is sufficiently fine. Fix a sufficiently large real number C_0 such that

$$\sup_{V_j \cap V_k^*} \left| \frac{\partial z_k}{\partial z_j} \right| \leq C_0$$

holds for each j, k with $U_k \cap C_{\text{sing}} = \emptyset$, and

$$\sup_{V_j \cap V_k^*} \left| \frac{\partial x_k}{\partial z_j} \right| \leq C_0, \quad \sup_{V_j \cap V_k^*} \left| \frac{\partial y_k}{\partial z_j} \right| \leq C_0$$

holds for each j, k with $U_k \cap C_{\text{sing}} \neq \emptyset$. Denote by $A(X) = X + \sum_{n=2}^{\infty} A_n X^n \in \mathbb{C}\{X\}$ the solution of the functional equation

$$A(X) - X = \frac{M_0(A(X))^2}{1 - R_0 A(X)}$$

with $A'(X) = 1$, where M_0, R_0 are sufficiently large real number (There uniquely exists such $A(X)$ for each M_0, R_0 , and clearly has a positive radius of convergence). Note that $A_n \geq 0$ holds for each $n \geq 2$. In the rest of this subsection, we will prove that

$$(4.5) \quad \sup_{V_j} |F_\nu^j| \leq 3A_\nu$$

holds for each $\nu \geq 2$, sufficiently large M_0, R_0 , and suitable $\{F_n^j\}$. For proving this, it is sufficient to show the following claim:

CLAIM 4.3. *For sufficiently large M_0, R_0 , there exists a system $\{F_n^j\}_{n=2}^{\infty}$ such that (Property) $_n$ holds and that, for each k such that $V_k \cap C_{\text{sing}} \neq \emptyset$, there exists a function*

$G_{+n}^k(x_k)$ with $G_{+n}^k(x_k(p_k)) = G_{+n}^k(0) = 0$ and a function $G_{-n}^k(y_k)$ with $G_{-n}^k(y_k(p_k)) = G_{-n}^k(0) = 0$ such that $F_n^k(x_k, y_k) = C_n^k + G_{+n}^k(x_k) + G_{-n}^k(y_k)$ holds on V_k . Moreover,

$$(4.6) \quad |C_\nu^j| \leq A_\nu \text{ and } \left| \frac{dF_\nu^j}{dz_j} \right| \leq A_\nu \quad \text{if } U_j \cap C_{\text{sing}} = \emptyset$$

$$|C_\nu^k| \leq A_\nu \text{ and } \left| \frac{dG_{+\nu}^k}{dx_k} \right|, \left| \frac{dG_{-\nu}^j}{dy_k} \right| \leq A_\nu \quad \text{if } U_k \cap C_{\text{sing}} \neq \emptyset$$

holds for each ν .

REMARK 4.4. Claim 4.3 actually deduces inequality (4.5). Indeed, for example, we can calculate

$$|G_{\pm\nu}^k(p)| = \left| \int_{p_k}^p (G_{\pm\nu}^k)' \right| \leq \varepsilon_k \sup |(G_{\pm\nu}^k)'| \leq A_\nu$$

on each V_k with $V_k \cap C_{\text{sing}} \neq \emptyset$ (Recall that we are assuming that $\varepsilon_k < 1$). Thus we obtain the inequality $|F_\nu^k| \leq |C_\nu^k| + |G_{+\nu}^k| + |G_{-\nu}^k| \leq 3A_\nu$.

For each j such that $V_j \cap C_{\text{sing}} = \emptyset$, we denote by $G_n^j = G_n^j(z_j)$ the function $F_n^j - C_n^j$. From now on, we will prove Claim 4.3 by induction. As $A_2 = M_0$, Claim 4.3 for $\nu = 2$ is clear. Assuming the existence of $\{F_\nu^j\}_{\nu=2}^{n-1}$ satisfying (Property) $_\nu$ and the inequality (4.6) for $\nu < n$, we will construct $\{F_n^j\}$ such that (Property) $_n$ and the inequality (4.6) for $\nu = n$ holds. First, let us fix sufficiently large real numbers M_1 and R such that

$$\sup_{U_{jk}} |f_\nu^{kj}| \leq M_1 R^\nu, \quad \sup_{U_{jk}} \left| \frac{df_\nu^{kj}}{dz_j} \right| \leq M_1 R^\nu$$

holds for each j, k . Then we can show the following lemma:

LEMMA 4.5. Assume that $\{F_\nu^j\}_{\nu=2}^{n-1}$ satisfies (Property) $_\nu$ and the inequality (4.6) for $\nu < n$. Then, by enlarging R if necessary, it holds that

$$\sup_{U_{jk}} |P_n^{kj} - t_{jk}^{-n+1} Q_n^{kj}| \leq \text{the coeff. of } X^n \text{ in } \frac{M_2(A(X))^2}{1 - 6RA(X)},$$

where $M_2 := 18R(1 + M_1R)$ and “coeff.” stands for “coefficient”.

PROOF. Assuming that R^{-1} is much smaller than the diameters of V_j 's, we obtain

$$|P_n^{kj}(p) - t_{jk}^{-n+1} Q_n^{kj}(p)| \leq \text{the coeff. of } X^n \text{ in } 2R(M_1R + 1) \frac{(3A(X))^2}{1 - 3RA(X)}$$

for each $p \in U_{jk}$ by the same argument as in [U83, p. 599], which proves the lemma. $\square$

LEMMA 4.6. Assume that $\{F_\nu^j\}_{\nu=2}^{n-1}$ satisfies (Property) $_\nu$ and the inequality (4.6) for $\nu < n$. Then, by enlarging R if necessary, it holds that

$$\sup_{U_{jk}} \left| \frac{d}{dz_j} (P_n^{kj} - t_{jk}^{-n+1} Q_n^{kj}) \right| \leq \text{the coeff. of } X^n \text{ in } \frac{M_3(A(X))^2}{1 - 6RA(X)},$$

where $M_3 := 12R(1 + C_0 + 6RM_1)$.

PROOF. From the equation (4.3), we obtain that

$$\begin{aligned}
\left| \frac{dP_n^{kj}}{dz_j} \right| &\leq \text{the coeff. of } X^n \text{ in } \sum_{\nu=2}^n \left| \frac{df_\nu^{kj}(z_j)}{dz_j} \right| \cdot \left(X + \sum_{\lambda=2}^{n-1} |F_\lambda^j| X^\lambda \right)^\nu \\
&\quad + \sum_{\nu=2}^n \nu |f_\nu^{kj}(z_j)| \cdot \left(X + \sum_{\lambda=2}^{n-1} |F_\lambda^j| X^\lambda \right)^{\nu-1} \cdot \left(\sum_{\lambda=2}^{n-1} \left| \frac{dF_\lambda^j}{dz_j} \right| X^\lambda \right) \\
&\leq \text{the coeff. of } X^n \text{ in } \sum_{\nu=2}^\infty \left(1 + \frac{\nu}{3} \right) M_1 R^\nu \cdot (3A(X))^\nu \\
&\leq \text{the coeff. of } X^n \text{ in } \sum_{\nu=2}^\infty 2^\nu M_1 R^\nu \cdot (3A(X))^\nu \\
&\leq \text{the coeff. of } X^n \text{ in } \frac{M_1 R^2 (6A(X))^2}{1 - 6RA(X)}
\end{aligned}$$

(Recall that $V_j \cap C_{\text{sing}} = \emptyset$). Assuming that R^{-1} is much smaller than the diameters of V_j 's, we also obtain

$$\sup_{U_j \cap U_k^*} \left| \frac{\partial F_{\nu\lambda}^{kj}}{\partial z_j} \right| = \sup_{U_j \cap U_k^*} \left| \frac{1}{\lambda!} \frac{\partial}{\partial z_j} \frac{\partial^\lambda F_\nu^k}{\partial w_j^\lambda} \right| = \sup_{U_j \cap U_k^*} \left| \frac{1}{\lambda!} \frac{\partial^\lambda}{\partial w_j^\lambda} \frac{\partial F_\nu^k}{\partial z_j} \right| \leq R^\lambda \sup_{V_j \cap V_k^*} \left| \frac{\partial F_\nu^k}{\partial z_j} \right|,$$

which implies the inequality

$$\sup_{U_j \cap U_k^*} \left| \frac{\partial F_{\nu\lambda}^{kj}}{\partial z_j} \right| \leq 2C_0 A_\nu R^\lambda.$$

Thus we can deduce the inequality

$$\begin{aligned}
\left| \frac{dQ_n^{kj}}{dz_j} \right| &= \text{the coeff. of } X^n \text{ in } \sum_{\nu=2}^\infty \sum_{\lambda=1}^\infty (2C_0 + \lambda) A_\nu R^\lambda \cdot (3A(X))^\lambda \cdot X^\nu \\
&\leq \text{the coeff. of } X^n \text{ in } \sum_{\nu=2}^\infty \sum_{\lambda=1}^\infty (1 + C_0) 2^\lambda A_\nu R^\lambda \cdot (3A(X))^\lambda \cdot X^\nu \\
&\leq \text{the coeff. of } X^n \text{ in } 6R(1 + C_0) \frac{(A(X))^2}{1 - 6RA(X)}
\end{aligned}$$

on $U_j \cap U_k^*$ from the equation (4.4). Therefore,

$$\sup_{U_j \cap U_k^*} \left| \frac{d}{dz_j} (P_n^{kj} - t_{jk}^{-n+1} Q_n^{kj}) \right| \leq \text{the coeff. of } X^n \text{ in } 6R(6RM_1 + 1 + C_0) \frac{(A(X))^2}{1 - 6RA(X)}$$

holds. For each point $p \in U_{jk}$, by using l such that $p \in U_l^*$, we can calculate

$$\begin{aligned}
\left| \frac{d}{dz_j} (P_n^{kj} - t_{jk}^{-n+1} Q_n^{kj})(p) \right| &\leq \left| \frac{d}{dz_j} (P_n^{lj} - t_{jl}^{-n+1} Q_n^{lj})(p) \right| + \left| \frac{d}{dz_j} (P_n^{lk} - t_{kl}^{-n+1} Q_n^{lk})(p) \right| \\
&\leq \text{the coeff. of } X^n \text{ in } 12R(6RM_1 + 1 + C_0) \frac{(A(X))^2}{1 - 6RA(X)},
\end{aligned}$$

which proves the lemma. $\square$

Let us fix a C^∞ Hermitian metric h of $K_{\tilde{C}}$, where $i: \tilde{C} \rightarrow C$ is the normalization, and consider $\eta_n := i^*\{(U_{jk}, d(P_n^{kj} - t_{jk}^{-n+1}Q_n^{kj}))\}$. The class of $H^1(\tilde{C}, \mathcal{O}_{\tilde{C}}(K_{\tilde{C}} \otimes i^*N_{C/X}^{-n+1}))$ defined by η_n is the trivial one. Thus, by Lemma 4.6, there exists a positive constant M_4 depends only on M_3 and h such that

$$\|\eta_n\|_h := \max_{\nu, \mu} \sup_{\tilde{U}_{\nu\mu}} |\eta_n^{\nu\mu}|_h \leq \text{the coeff. of } X^n \text{ in } \frac{M_4(A(X))^2}{1 - 6RA(X)}$$

holds, where $\{\tilde{U}_\nu\}$ is the open cover of $\tilde{C}$ as in Remark 2.2 and $\eta_n^{\nu\mu}$ is the 1-form such that $i^*\{(U_{jk}, d(P_n^{kj} - t_{jk}^{-n+1}Q_n^{kj}))\} = \{(\tilde{U}_{\nu\mu}, \eta_n^{\nu\mu})\}$ holds. Thus we can deduce from [KS, Lemma 2] that there exists a positive real number K and $\{(\tilde{U}_\nu, \eta_n^\nu)\} \in \check{C}^0(\{\tilde{U}_\nu\}, \mathcal{O}_{\tilde{C}}(K_{\tilde{C}} \otimes i^*N_{C/X}^{-n+1}))$ such that

$$\eta_n^\nu - t_{jk}^{-n+1}\eta_n^\mu = \eta_n^{\nu\mu} = (i|_{\tilde{U}_{\nu\mu}})^* d(P_n^{kj} - t_{jk}^{-n+1}Q_n^{kj}), \quad \sup_{\tilde{U}_\nu} |\eta_n^\nu|_h \leq K\|\eta_n\|_h$$

holds, where $i^{-1}(U_{jk}) = \tilde{U}_{\nu\mu}$. Note that K can be taken as a constant which does not depend on n (Here we used the assumption that $i^*N_{C/X} \in \mathcal{E}_0(\tilde{C})$).

Now we start constructing functions G_n^j , $G_{\pm n}^j$. First we consider on V_j such that $U_j \cap C_{\text{sing}} = \emptyset$. In this case, U_j is isomorphic to $\tilde{U}_\nu$ for some ν via i . We define G_n^j as the extension of the function

$$G_n^j(p) := \int_{p_j}^p (i|_{\tilde{U}_\nu}^{-1})^* \eta_n^\nu$$

defined on U_j . Next we consider on V_k such that $U_k \cap C_{\text{sing}} \neq \emptyset$. In this case, U_k is decomposed to two irreducible component $\{x_k = 0\}$ and $\{y_k = 0\}$. Take ν, μ such that $i^{-1}(\{x_k = 0\}) = \tilde{U}_\nu$ and $i^{-1}(\{y_k = 0\}) = \tilde{U}_\mu$ holds. We define the function G_{+n}^k as the extension of the function

$$G_{+n}^k(p) := \int_{p_k}^p (i|_{\tilde{U}_\mu}^{-1})^* \eta_n^\mu$$

defined on $\{y_k = 0\}$, and define the function G_{-n}^k as the extension of the function

$$G_{-n}^k(p) := \int_{p_k}^p (i|_{\tilde{U}_\nu}^{-1})^* \eta_n^\nu$$

defined on $\{x_k = 0\}$. By constructions, there clearly exists a positive real number C_1 depending only on h such that $\sup_{U_j} |G_n^j| \leq C_1 K \|\eta_n\|_h$ ($\sup_{U_k} |G_{\pm n}^k| \leq C_1 K \|\eta_n\|_h$) holds. Thus it holds that

$$(4.7) \quad \sup_{U_j} |G_n^j|, \sup_{U_k} |G_{\pm n}^k| \leq \text{the coeff. of } X^n \text{ in } \frac{M_5(A(X))^2}{1 - 6RA(X)},$$

where $M_5 := C_1 K M_4$.

Next, we give the construction of C_n^j . Clearly

$$C_n^{kj} := \begin{cases} (P_n^{kj} - t_{jk}^{-n+1}Q_n^{kj})|_{U_{jk}} - (G_n^j - t_{jk}^{-n+1}G_n^k)|_{U_{jk}} & (U_k \cap C_{\text{sing}} = \emptyset) \\ (P_n^{kj} - t_{jk}^{-n+1}Q_n^{kj})|_{U_{jk}} - (G_n^j - t_{jk}^{-n+1}(G_{+n}^k + G_{-n}^k))|_{U_{jk}} & (U_k \cap C_{\text{sing}} \neq \emptyset) \end{cases}$$

is a constant for each j, k . Thus it follows from Lemma 4.1 that there exists a positive constant K_1 and a 0-cochain $\{(U_j, C_n^j)\} \in \check{C}^0(\{U_j\}, \mathbb{C}(N_{C/X}^{-n+1}))$ such that

$$(4.8) \quad C_n^j - t_{jk}^{-n+1} C_n^k = C_n^{kj}, \quad |C_n^j| \leq K_1 \max_{j,k} |C_n^{kj}|$$

holds for each j, k (Here we used the assumption that $H^1(C, \mathbb{C}(N_{C/X}^{-n+1})) = 0$). From the assumption that $N_{C/X} \in \mathcal{E}_0(C)$, it holds that K_1 can be taken as a constant which does not depend on n .

Now let us consider

$$F_n^j := \begin{cases} C_n^j + G_n^j & (U_j \cap C_{\text{sing}} = \emptyset) \\ C_n^j + G_{+n}^j + G_{-n}^j & (U_j \cap C_{\text{sing}} \neq \emptyset). \end{cases}$$

Then, it follows from the argument in the previous subsection that the system $\{F_\nu^j\}_{\nu=2}^n$ satisfies (Property) $_n$. As the inequality (4.7) and

$$\begin{aligned} |C_n^j| &\leq K_1 \max_{j,k} |C_n^{kj}| \\ &\leq K_1 \|\{(U_{jk}, P_n^{kj} - t_{jk}^{-n+1} Q_n^{kj})\}\| + 2K_1 \cdot \left(\text{the coeff. of } X^n \text{ in } \frac{M_5(A(X))^2}{1 - 6RA(X)} \right) \\ &\leq \text{the coeff. of } X^n \text{ in } K_1(M_2 + 2M_5) \frac{(A(X))^2}{1 - 6RA(X)} \end{aligned}$$

holds, letting $K_1 > 1$, all we have to do is to show the inequality

$$\text{the coeff. of } X^n \text{ in } K_1(M_2 + 2M_5) \frac{(A(X))^2}{1 - 6RA(X)} \leq A_n,$$

which is clear by letting $M_0 := K_1(M_2 + 2M_5)$ and $R_0 := 6R$. $\square$

4.2.4. Convergence of the functional equation (4.1) for the case $N_{C/X} \in \mathcal{E}_1(C)$. In this subsection, we prove that the formal power series $X + \sum_{n=2}^\infty (\sup_{V_j} |F_n^j|) \cdot X^n$ has a positive radius of convergence for a suitable choice of $\{F_n^j\}$ when $N_{C/X} \in \mathcal{E}_1(C)$.

Let M_1 and R be those in the previous subsection. Fixing a sufficiently large positive real number K_2 , consider the constants $M_0 := K_2(M_2 + M_5)$ and $R_0 := 6R$, where M_2 and M_5 are the constants appeared in the previous section (Recall that M_2 and M_5 depend only on the choice of M_1, R , and the metric h on $K_{\tilde{C}}$). Let $A(X) = X + \sum_{n=2}^\infty A_n X^n$ be the formal power series defined by

$$(4.9) \quad \sum_{n=2}^\infty (M_5 + d(\mathcal{O}_C, N_{C/X}^{n-1})^{-1} \cdot M_0)^{-1} \cdot A_n X^n = \frac{(A(X))^2}{1 - R_0 A(X)}.$$

LEMMA 4.7. $A(X)$ has a positive radius of convergence.

PROOF. Let us denote $\varepsilon_n := M_5 + d(\mathcal{O}_C, N_{C/X}^n)^{-1} \cdot M_0$. It is sufficient to show the following two assertions: (1) $-\log \varepsilon_n = O(\log n)$ as $n \rightarrow \infty$, (2) $\varepsilon_{n-m}^{-1} \leq \varepsilon_n^{-1} + \varepsilon_m^{-1}$ for

$m < n$ ([Sie], see also [U83, Lemma 5]). (1) follows from the assumption $N_{C/X} \in \mathcal{E}_1(C)$. (2) follows from the inequality

$$\varepsilon_{n-m}^{-1} = \frac{d(N_{C/X}^n, N_{C/X}^m)}{M_0 + M_5 \cdot d(N_{C/X}^n, N_{C/X}^m)} \leq \frac{d(\mathcal{O}_C, N_{C/X}^n) + d(\mathcal{O}_C, N_{C/X}^m)}{M_0 + M_5 \cdot (d(\mathcal{O}_C, N_{C/X}^n) + d(\mathcal{O}_C, N_{C/X}^m))}.$$

□

It is sufficient to show that Claim 4.3 is also true for $A(X)$ above under the condition $N_{C/X} \in \mathcal{E}_1(C)$. As in the previous subsection, we will construct $\{F_n^j\}$ such that (Property) $_n$ and the inequality (4.6) for $\nu = n$ holds by assuming the existence of $\{F_\nu^j\}_{\nu=2}^{n-1}$ satisfying (Property) $_\nu$ and the inequality (4.6) for $\nu < n$. Note that Lemma 4.5, Lemma 4.6, and the inequality (4.7) holds also in the present setting. Thus we can take C_n^j as (4.8). However, under the present assumption, we can not take K_1 as a constant which depends on n (At least, the existence of such K_1 does not followed directly from Lemma 4.1 in the present setting). So here we use Lemma 4.1 instead of Lemma 4.1 to deduce that there exists a positive constant K_2 which does not depend on n such that $|C_n^j| \leq d(C, N_{C/X}^{-n})^{-1} \cdot K_2 \cdot \max_{j,k} |C_n^{jk}|$ holds. Since

$$\begin{aligned} |C_n^j| &\leq \text{the coeff. of } X^n \text{ in } d(C, N_{C/X}^{-n})^{-1} K_2 (M_2 + 2M_5) \frac{(A(X))^2}{1 - 6RA(X)} \\ &\leq \text{the coeff. of } X^n \text{ in } (M_5 + d(C, N_{C/X}^{-n})^{-1} M_0) \frac{(A(X))^2}{1 - 6RA(X)}, \end{aligned}$$

it is sufficient to show the inequality

$$\text{the coeff. of } X^n \text{ in } (M_5 + d(C, N_{C/X}^{-n})^{-1} M_0) \frac{(A(X))^2}{1 - 6RA(X)} \leq A_n,$$

which is clearly followed by the equation (4.9). □

5. PROOF OF THEOREM 1.5

In this section, we prove Theorem 1.5. Let $i: \tilde{C} \rightarrow C$ be the normalization. Fix a neighborhood V of C and a sufficiently fine open covering $\{V_j\}$ of V . We may assume the open covering $\{U_j\}$ of C defined by $U_j := V_j \cap V_j$ is enough fine to satisfy the conditions in Remark 2.2. Let $\{(V_j, w_j)\}$ be a system of order n , where n is the type of the pair (C, X) . From the arguments in [U83, §3.4], it is sufficient for proving Theorem 1.5 to construct a real-valued C^∞ function φ_λ on $V \setminus C$ for each $\lambda > 0$ which satisfies the following three properties:

(Property 1): $\varphi_\lambda(p) = d(p, C)^{-\lambda n} + o(d(p, C)^{-\lambda n})$ as $p \rightarrow \infty$.

(Property 2): φ_λ is a strongly psh function on $V \setminus C$ if $\lambda > 1$.

(Property 3): The complex Hessian of φ_λ has a positive and negative eigenvalue at each point in $V \setminus C$ if $\lambda < 1$.

Note that, by Proposition 2.5, the natural map $H^1(C, \mathbb{C}(N_{C/X}^m)) \rightarrow H^1(C, \mathcal{O}_C(N_{C/X}^m)) \oplus H^1(C, \overline{\mathcal{O}_C}(N_{C/X}^m))$ is isomorphism for all integer m (Here we used the assumption that

$G(C)$ is a tree and that $N_{C/X} = \mathcal{O}_C$). Thus we can run the same argument as in [U83, §3.3] and then construct a function $s: V \setminus C \rightarrow \mathbb{R}$ such that

$$s|_{V_j} = |w|^{-2n} - w^{-n}g - \overline{w}^{-n}\overline{g} - w^{-n} \cdot \overline{\left(\sum_{a,b \geq 0, 1 \leq a+b \leq n} \varphi_{ab} w^a \overline{w}^b \right)} \\ - \overline{w}^{-n} \cdot \left(\sum_{a,b \geq 0, 1 \leq a+b \leq n} \varphi_{ab} w^a \overline{w}^b \right) + |g|^2 + |w| \cdot \alpha$$

holds for some holomorphic function $g = g_j$ defined on V_j , pluriharmonic functions $\varphi_{ab} = \varphi_j|_{ab}$ defined on V_j , and some C^∞ function $\alpha = \alpha_j$ defined on V_j , where we are denoting by w the function w_j . Moreover, it can also be assumed that the element of $H^1(C, \mathcal{O}_C(N_{C/X}^{-n}))$ defined by $\delta\{(U_j, \overline{g}_j|_{U_j})\}$ coincides with the class defined by $\{(U_{jk}, (w_j^{-n} - t_{jk}^{-n} w_k^{-n})|_{U_{jk}})\}$, where $t_{jk} \in U(1)$ is a transition function of $N_{C/X}$ on U_{jk} . From this fact and the assumption that $u_n(C, X)|_{C_\nu} \neq 0 \in H^1(C_\nu, \mathcal{O}_C|_{C_\nu})$ for each irreducible component C_ν of C , it follows that $dg_j|_{U_j} \not\equiv 0$ holds for all U_j . Thus it follows from the calculation in [U83, §3.3] that, after a small modification, $s^{\frac{\lambda}{2}}$ satisfies (Property 1), (Property 2), and (Property 3) on each V_j such that $V_j \cap C_{\text{sing}} = \emptyset$.

Thus all we have to do is to modify the function $s^{\frac{\lambda}{2}}$ around each singular point $p \in C_{\text{sing}}$ and show it satisfies (Property 1), (Property 2), and (Property 3). We assume $C_{\text{sing}} = \{p\} \subset U_k$ for simplicity. In the rest of this section, we always consider on V_k and omit the index k ($w = w_k$, $g = g_k$ for example). Fix a coordinates system (x, y) such that $w = x \cdot y$. Note that we may assume g can be written in the form $g(x, y) = g_1(x) + g_2(y)$, where g_1 (g_2) is a holomorphic function depending only on the valuable x (y , respectively). Moreover, we may assume that $\{dg_1 = 0\} \subset \{x = 0\}$ and $\{dg_2 = 0\} \subset \{y = 0\}$ hold by shrinking U_k if necessary. By using a coordinates system $(w, z) := (x \cdot y, y) = (w, y)$ on $\{x \cdot y \neq 0\}$, we can calculate the complex Hessian

$$H_\lambda := \begin{bmatrix} (s^{\frac{\lambda}{2}})_{w\overline{w}} & (s^{\frac{\lambda}{2}})_{w\overline{z}} \\ (s^{\frac{\lambda}{2}})_{z\overline{w}} & (s^{\frac{\lambda}{2}})_{z\overline{z}} \end{bmatrix}$$

of $s^{\frac{\lambda}{2}}$ as follows:

$$H_\lambda = \frac{\lambda}{2} |w|^{-(\lambda-2)n} \cdot \begin{bmatrix} \frac{\lambda}{2} n^2 |w|^{-2n-2} \cdot (1 + O(|w|)) & (\frac{\lambda}{2} - 1) n w^{-1} \overline{w}^{-n} \overline{g}_z \cdot (1 + O(|w|)) \\ (\frac{\lambda}{2} - 1) n \overline{w}^{-1} w^{-n} g_z \cdot (1 + O(|w|)) & \frac{\lambda}{2} |g_z|^2 \end{bmatrix}.$$

Thus it holds that

$$\det H_\lambda = \frac{(\lambda-1)\lambda^2 n^2}{4} |g_z|^2 |w|^{-2(\lambda n - n + 1)} (1 + O(|w|)).$$

Note that, as

$$g_z = (g_1 + g_2)_z = (g_1)_x \cdot \left(\frac{w}{z}\right)_z + (g_2)_y = \frac{-x \cdot (g_1)_x + y \cdot (g_2)_y}{y}$$

does not vanishes on each point in $\{x \neq 0\} \cup \{y \neq 0\}$, it is sufficient to modify $s^{\frac{\lambda}{2}}$ only around p . Letting $\rho(x, y)$ be a C^∞ cut-off function such that $\rho|_{\{|x|^2 + |y|^2 < \delta\}} \equiv 1$ and

Supp $\rho \subset \{|x|^2 + |y|^2 < 2\delta\}$ hold for some sufficiently small number $\delta > 0$, consider the function φ_λ defined by

$$\varphi_\lambda := \begin{cases} s^{\frac{\lambda}{2}} + \varepsilon \rho(x, y) \cdot \left(|z|^2 + \frac{|w|^2}{|z|^2} \right) \cdot |w|^{-(\lambda-2)n} & (\lambda > 1) \\ s^{\frac{\lambda}{2}} - \varepsilon \rho(x, y) \cdot \left(|z|^2 + \frac{|w|^2}{|z|^2} \right) \cdot |w|^{-(\lambda-2)n} & (0 < \lambda < 1), \end{cases}$$

where ε is a sufficiently small positive real number. As the complex Hessian of the function $R_\lambda(w, z) := \left(|z|^2 + \frac{|w|^2}{|z|^2} \right) \cdot |w|^{-(\lambda-2)n}$ can be calculated as

$$\begin{bmatrix} (R_\lambda)_{w\bar{w}} & (R_\lambda)_{w\bar{z}} \\ (R_\lambda)_{z\bar{w}} & (R_\lambda)_{z\bar{z}} \end{bmatrix} = |w|^{-(\lambda-2)n} \begin{bmatrix} O\left(\frac{1}{|w|^2}\right) & o\left(\frac{1}{w^2}\right) \\ o\left(\frac{1}{\bar{w}^2}\right) & 1 + \frac{|w|^2}{|z|^4} \end{bmatrix},$$

we can conclude that, by shrinking ε if necessary, the above function φ_λ satisfies (Property 1), (Property 2), and (Property 3). $\square$

6. PROOF OF THEOREM 1.6

In this section, we prove Theorem 1.6. Let $C = C_1 \cup C_2 \cup \cdots \cup C_N$ be the irreducible decomposition of C and let $C_N \cap C_1 = \{p_1\}$, $C_\nu \cap C_{\nu+1} = \{p_\nu\}$ ($\nu = 2, 3, \dots, N$). In the following, we sometimes denote p_N by p_0 and C_N by C_0 . Fix a neighborhood V of C and a sufficiently fine open covering $\{V_j\}$ of V . Denote by $\{U_j\}$ the induced open covering of C : $U_j := V_j \cap C$. We may assume that $\{U_j\}$ satisfies the conditions in Remark 2.2. Denote by U_{k_ν} the open set which includes p_ν as an element. Each U_{k_ν} has two irreducible components $U_{k_\nu}^{(\nu-1)} \subset C_{\nu-1}$ and $U_{k_\nu}^{(\nu)} \subset C_\nu$. Denoting by $U_j^{(\nu)}$ the open set U_j by using ν which satisfies $U_j \subset C_\nu$ for each $j \notin \{k_1, k_2, \dots, k_N\}$, $\{U_j^{(\nu)} \mid j = k_\nu \text{ or } j = k_{\nu+1} \text{ or } U_j \subset C_\nu\}$ defines an open covering of C_ν for each $\nu = 0, 1, \dots, N-1$.

From the arguments in [U83, §3.4], it is sufficient for proving Theorem 1.6 to construct a real-valued C^∞ function φ_λ on $V \setminus C$ for each $\lambda > 0$ which satisfies the following three properties:

(Property 1): $\varphi_\lambda(p) = (\log d(p, C))^{2\lambda} + o((\log d(p, C))^{2\lambda})$ as $p \rightarrow \infty$.

(Property 2): φ_λ is a strongly psh function on $V \setminus C$ if $\lambda > 1$.

(Property 3): The complex Hessian of φ_λ has a positive and negative eigenvalue at each point in $V \setminus C$ if $\lambda < 1$.

LEMMA 6.1. *For a suitable positive number $\alpha \in \mathbb{R}$ and $\{t_{jk}\} \subset \mathbb{C}^*$ such that $N_{C/X} = \{(U_{jk}, t_{jk})\}$, the following conditions hold: $|t_{jk}| = 1$ holds if $j, k \neq k_1$, or if $j \neq k_1$ and $U_j \subset C_1$ hold. $|t_{jk_1}| = \alpha$ holds if $U_j \subset C_N$.*

PROOF. It can be shown by the same argument as in the proof of Lemma 2.1 by using the normalization $i_1: \tilde{C}_1 \rightarrow C$ of C at p_1 instead of the normalization $i: \tilde{C} \rightarrow C$ (Note that, by Lemma 2.4, $i_1^* N_{C/X}$ is flat). $\square$

Fix $\alpha, \{t_{jk}\}$ as in Lemma 6.1. Note that, by the assumption that $N_{C/X}$ is not flat, $\alpha \neq 1$ holds. Fix also a system $\{(V_j, w_j)\}$ of order 4.

LEMMA 6.2. *There exists a nowhere vanishing holomorphic function f_j on V_j for each $j \notin \{k_1, k_2, \dots, k_N\}$ and a coordinates system (x_ν, y_ν) of V_{k_ν} for each $k_\nu (\nu = 1, 2, \dots, N)$ such that the following conditions hold:*

- (i) *For each $j \notin \{k_1, k_2, \dots, k_N\}$, f_j depends only on the valuable z_j , where z_j is a function such that (w_j, z_j) is a coordinates system of V_j .*
- (ii) *For each j, k such that $U_j, U_k \subset C_\nu$, there exists an element $s_{jk} \in U(1)$ such that $s_{jk}f_k = f_j + O(w_j)$ holds on V_{jk} .*
- (iii) *$\{x_\nu = 0\} = U_{k_\nu}^{(\nu-1)}$ and $\{y_\nu = 0\} = U_{k_\nu}^{(\nu)}$ hold on $V_{k_\nu} (\nu = 1, 2, \dots, N)$.*
- (iv) *For each j and $\nu = 1, 2, \dots, N$ such that $U_{jk_\nu} \neq \emptyset$, there exists an element $s_{jk_\nu} \in U(1)$ such that $s_{jk_\nu}y_\nu^{-1} = f_j + O(w_j)$ holds if $U_j \subset C_{\nu-1}$, and that $s_{jk_\nu}x_\nu = f_j + O(w_j)$ holds if $U_j \subset C_\nu$.*

PROOF. As C_ν is non-singular, $\mathcal{O}_{C_\nu}(p_\nu - p_{\nu+1})$ is flat for each $\nu = 0, 1, \dots, N-1$. Thus there exists $s_{jk} \in U(1)$ for each j, k and a holomorphic function $F_j^{(\nu)}$ on $U_j^{(\nu)}$ for each j such that $F_j^{(\nu)} = s_{jk}F_k^{(\nu)}$ holds on $U_{jk}^{(\nu)}$. f_j, x_ν, y_ν^{-1} can be constructed by extending each $F_j^{(\nu)}$ to V_j in a suitable manner. $\square$

REMARK 6.3. In Lemma 6.2, we may additionally assume that $S_\nu|_{U_{k_\nu}}$ is a constant function for each ν , where $S_\nu := (w_{k_\nu}/(x_\nu \cdot y_\nu))$. Here we will show this assertion by modifying (x_ν, y_ν) as in Lemma 6.2 and constructing a new coordinates system $(\tilde{x}_\nu, \tilde{y}_\nu)$ with $(w_{k_\nu}/(\tilde{x}_\nu \cdot \tilde{y}_\nu))|_{U_{k_\nu}} \equiv q_\nu$, where $q_\nu := S_\nu(p_\nu)$. Let Q_ν be a holomorphic function defined on V_{k_ν} which coincides with S_ν/q_ν on $U_{k_\nu}^{(\nu)}$ and with the constant function 1 on $U_{k_\nu}^{(\nu-1)}$, and consider $\tilde{y}_\nu := Q_\nu \cdot y_\nu$. $\tilde{y}_\nu$ coincides with y_ν on $U_{k_\nu}^{(\nu-1)}$ and satisfies that $\tilde{S}_\nu|_{U_{k_\nu}^{(\nu)}} \equiv q_\nu$, where $\tilde{S}_\nu := (w_{k_\nu}/(x_\nu \cdot \tilde{y}_\nu))$. Let $\tilde{Q}_\nu$ be a holomorphic function defined on V_{k_ν} which coincides with $\tilde{S}_\nu/q_\nu$ on $U_{k_\nu}^{(\nu-1)}$ and with the constant function 1 on $U_{k_\nu}^{(\nu)}$, and consider $\tilde{x}_\nu := \tilde{Q}_\nu \cdot x_\nu$. $\tilde{x}_\nu$ coincides with x_ν on $U_{k_\nu}^{(\nu)}$ and satisfies that $(w_{k_\nu}/(\tilde{x}_\nu \cdot \tilde{y}_\nu))|_{U_{k_\nu}} \equiv q_\nu$ holds, which shows the assertion.

LEMMA 6.4. *There exists a constant $q \in \mathbb{C}^*$ and functions $\{f_j\}, \{(x_\nu, y_\nu)\}$ as in Lemma 6.2 such that $S_\nu|_{U_{k_\nu}} \equiv q$ holds for each $\nu \in \{1, 2, \dots, N\}$, where $\tilde{S}_\nu := w_{k_\nu}/(x_\nu \cdot y_\nu)$.*

PROOF. By Remark 6.3, we may assume that the function $S_\nu = w_{k_\nu}/(x_\nu \cdot y_\nu)$ coincides with the constant function q_ν on U_ν . Fix a complex number q such that $q^N = q_1 \cdot q_2 \cdots q_N$ and consider a sequence $\{a_1, a_2, \dots, a_N\} \subset \mathbb{C}^*$ which is defined by $a_1 := 1$ and $a_\nu := q^{-1} \cdot q_\nu \cdot a_{\nu-1}$. Let us denote by $\tilde{f}_j$ the function $a_\nu f_j$ for each j such that $U_j \subset C_\nu$, and by $(\tilde{x}_\nu, \tilde{y}_\nu)$ the new coordinates system of V_{k_ν} defined by $\tilde{x}_\nu := a_\nu \cdot x_\nu, \tilde{y}_\nu := a_{\nu-1}^{-1} \cdot y_\nu$. Then the assertion follows from the fact that $(w_{k_\nu}/(\tilde{x}_\nu \cdot \tilde{y}_\nu))|_{U_\nu}$ is the constant function $q_\nu \cdot a_{\nu-1} \cdot a_\nu^{-1}$. $\square$

Now we start constructing φ_λ by using $\{f_j\}, \{(x_\nu, y_\nu)\}, q$ as in Lemma 6.4. By replacing each w_j with $q^{-1} \cdot w_j$, we assume that $q = 1$. Define the function φ_j on each $V_j \subset U_j$ as follows:

$$\varphi_j := (\log |w_j|)^2 + \frac{N-2\nu}{N} \cdot \log \alpha \cdot \log |w_j| + \frac{2}{N} \cdot \log \alpha \cdot \log |f_j|$$

if $U_j \subset C_\nu$ holds for some $\nu \in \{1, 2, \dots, N\}$, and

$$\varphi_{k_\nu} := (\log |w_{k_\nu}|)^2 + \frac{N - 2(\nu - 1)}{N} \cdot \log \alpha \cdot \log |w_{k_\nu}| - \frac{2}{N} \cdot \log \alpha \cdot \log |y_\nu|$$

for each $\nu = 1, 2, \dots, N$. Let $\{\rho_j\}$ be a system of C^∞ functions $\rho_j: V_j \rightarrow [0, 1] \subset \mathbb{R}$ such that $\text{Supp } \rho_j \subset V_j$ holds for each j and $(\sum_j \rho_j)|_{V_0} \equiv 1$ holds for some neighborhood V_0 of C in V . Since the calculation as in [U91, p. 687] shows that

$$\eta_{jk}(p) := \begin{cases} \varphi_k(p) - \varphi_j(p) & (p \in V_{jk} \setminus U_{jk}) \\ 0 & (p \in U_{jk}) \end{cases}$$

is a C^2 class function defined on V_{jk} for each j, k such that $U_{jk} \neq \emptyset$. Let us denote by φ the function on $V \setminus C$ such that $\varphi|_{V_j} = \varphi_j + \sum_k \rho_k \cdot \eta_{jk}$ for each j .

We will construct a function φ_λ with (Property 1), (Property 2), and (Property 3) by modifying the function φ^λ . First we obtain from the same calculation as in [U91, p. 689] that

$$\frac{\varphi^{-\lambda+2}}{\lambda} \begin{bmatrix} (\varphi^\lambda)_{w\bar{w}} & (\varphi^\lambda)_{w\bar{z}} \\ (\varphi^\lambda)_{z\bar{w}} & (\varphi^\lambda)_{z\bar{z}} \end{bmatrix} = \begin{bmatrix} (\lambda - \frac{1}{2}) \frac{(\log |w|)^2}{|w|^2} (1 + o(1)) & (\lambda - 1) \frac{-B \log |w|}{w\bar{z}} (1 + o(1)) \\ (\lambda - 1) \frac{-B \log |w|}{|\bar{w}z|^2} (1 + o(1)) & (\lambda - 1) \frac{B^2}{|z|^2} (1 + o(1)) \end{bmatrix}$$

holds on each $V_{k_\nu} \setminus U_{k_\nu}$ for each $\nu = 1, 2, \dots, N$, where $(w, z) = (w_{k_\nu}, y_\nu)$ and $B = \frac{\log \alpha}{N}$. Note the determinant of the above matrix is

$$\frac{\lambda - 1}{2} \frac{B^2 (\log |w|^2)}{|wz|^2} = \frac{\lambda - 1}{2} \cdot \frac{(\log \alpha)^2}{N^2} \cdot \frac{(\log |w|^2)}{|wz|^2}.$$

For each j such that $U_j \subset C_\nu$, we obtain from the same calculation as in [U91, p. 688] that the above matrix with $(w, z) := (w_j, z_j)$ is

$$\begin{bmatrix} (\lambda - \frac{1}{2}) \frac{(\log |w|)^2}{|w|^2} (1 + o(1)) & (\lambda - 1) \frac{\log \alpha}{N} \cdot \frac{\log |w|}{w} \overline{\left(\frac{(f_j)_z}{f_j} \right)} (1 + o(1)) \\ (\lambda - 1) \frac{\log \alpha}{N} \cdot \left(\frac{\log |w|}{w} \right) \frac{(f_j)_z}{f_j} (1 + o(1)) & (\lambda - 1) \frac{(\log \alpha)^2}{N^2} \cdot \left| \frac{(f_j)_z}{f_j} \right|^2 \end{bmatrix},$$

whose determinant is

$$\frac{\lambda - 1}{2} \frac{(\log \alpha)^2}{N^2} \cdot \left| \frac{(f_j)_z}{f_j} \right|^2 \frac{(\log |w|)^2}{|w|^2} (1 + o(1)).$$

Thus it turns out that the function $\varphi_\lambda := \varphi^\lambda$ satisfies (Property 1), (Property 2), and (Property 3) if each function $(f_j)_{z_j}$ has no zero.

In the rest of this section, we construct a function φ_λ with (Property 1), (Property 2), and (Property 3) when there uniquely exists a open set U_j ($j \notin \{k_1, k_2, \dots, k_N\}$) such that $(f_j)_{z_j}$ vanishes only on $\{z_j = 0\}$, for simplicity. Letting $\chi(z_j)$ be a C^∞ cut-off function such that $\chi|_{\{|z_j| < \delta\}} \equiv 1$ and $\text{Supp } \chi \subset \{|z_j|^2 < 2\delta\}$ hold for some sufficiently small number $\delta > 0$, consider the function φ_λ defined by

$$\varphi_\lambda := \begin{cases} \varphi(w_j, z_j)^\lambda + \varepsilon \lambda \cdot \chi(z_j) \cdot (-\log |w_j|)^{2(\lambda-2)} \cdot |z_j|^2 & (\lambda > 1) \\ \varphi(w_j, z_j)^\lambda - \varepsilon \lambda \cdot \chi(z_j) \cdot (-\log |w_j|)^{2(\lambda-2)} \cdot |z_j|^2 & (0 < \lambda < 1), \end{cases}$$

where $\varepsilon > 0$ is a sufficiently small positive real number. As

$$(-\log |w|)^{-\lambda+2} \begin{bmatrix} (R_\lambda)_{w\bar{w}} & (R_\lambda)_{w\bar{z}} \\ (R_\lambda)_{z\bar{w}} & (R_\lambda)_{z\bar{z}} \end{bmatrix} = \begin{bmatrix} O\left(\frac{1}{|w|^2(-\log |w|)^2}\right) & O\left(\frac{1}{w(-\log |w|)}\right) \\ O\left(\frac{1}{\bar{w}(-\log |w|)}\right) & (\chi(z) \cdot |z|^2)_{z\bar{z}} \end{bmatrix}$$

holds for $R_\lambda := (-\log |w_j|)^{2(\lambda-2)} \cdot |z_j|^2$ and $(w, z) := (w_j, z_j)$, we can conclude that, by shrinking ε if necessary, the above function φ_λ satisfies (Property 1), (Property 2), and (Property 3). $\square$

7. PROOF OF THEOREM 1.1 AND APPLICATION TO THE BLOW-UP OF THE PROJECTIVE PLANE AT NINE POINTS

7.1. Minimal singular metrics of the anti-canonical bundle of the blow-up of the projective plane at nine points. In this section, we will prove Theorem 1.1. We also study singular Hermitian metrics with semi-positive curvature on K_X^{-1} of the blow-up X of $\mathbb{P}^2$ at nine points in arbitrary position by applying Theorem 1.4 and Theorem 1.6, and prove the following:

THEOREM 7.1. *Let $p_1, p_2, \dots, p_9 \in \mathbb{P}^2$ be 9 points different from each other, $\pi: X \rightarrow \mathbb{P}^2$ be the blow-up at $\{p_j\}_{j=1}^9$. Then one of the following five assertions holds:*

- (i) K_X^{-1} is semi-ample (i.e. K_X^{-n} is generated by global sections for some integer n).
- (ii) K_X^{-1} is not semi-ample, however it is semi-positive (i.e. K_X^{-1} admits a C^∞ Hermitian metric with semi-positive curvature).
- (iii) K_X^{-1} is nef and there exists a section $f \in H^0(X, K_X^{-1}) \setminus \{0\}$ such that the singular Hermitian metric $|f|^{-2}$ is a minimal singular metric (i.e. a metric with the mildest singularities among singular Hermitian metrics of K_X^{-1} whose local weights are psh). In this case, K_X^{-1} is not semi-positive.
- (iv) K_X^{-1} is nef, and there exists a compact curve $C \subset X$ with nodes such that $N_{C/X} \in \mathcal{P}_0(C) \setminus (\mathcal{E}_0(C) \cup \mathcal{E}_1(C))$ and $K_X^{-1} = \mathcal{O}_X(C)$.
- (v) K_X^{-1} is not nef, and the nef part of the Zariski decomposition of K_X^{-1} is semi-ample.

For the precise definition of minimal singular metrics, see [DPS, Definition 1.4].

REMARK 7.2. It also follows from the proof of Theorem 7.1 blow that none of the five conditions (i), (ii), $\dots$, (v) in Theorem 7.1 can be removed, since there exists configurations for which each condition is realized.

REMARK 7.3. Note that, except the case of Theorem 7.1 (iv), we can determine the concrete expression of a minimal singular metric on K_X^{-1} . For the case (i) and (ii), K_X^{-1} is semi-positive and thus a minimal singular metric can be taken as a C^∞ one and thus it has no singularity. For the case (v), the metric $h_{\min} = h_P \otimes \prod_j |g_j|^{-2a_j}$ is a minimal singular metric of K_X^{-1} , where h_P is a C^∞ Hermitian metric on the nef part P of Zariski decomposition of K_X^{-1} with semi-positive curvature, $N = \sum_j a_j D_j$ is the negative part, and $g_j \in H^0(X, \mathcal{O}_X(D_j))$ is the canonical section for each j (The minimal singularity of

the above metric directly follows from the fact that, for all closed (semi-)positive current T in the class $c_1(K_X^{-1})$, the Lelong number $\nu(T, D_j)$ of T along D_j is greater than or equal to a_j for each j (see [Bo, p. 54]).

7.2. Preliminary for the proof of Theorem 1.1 and Theorem 7.1. In this subsection, we give some lemmata and propositions needed in the proof of Theorem 1.1 and Theorem 7.1. First we show the following:

LEMMA 7.4. *Let X be a non-singular rational surface and $C \subset X$ be a reduced compact curve with only nodes such that $N_{C/X} \in \mathcal{E}_0(C)$. Assume one of the following conditions:*
 (1) *C is a non-singular elliptic curve.*
 (2) *Each component of the normalization of C is a rational curve, and the Euler number of the dual graph $G(C)$ is equal to 0.*
Then $\mathcal{O}_X(C)$ is semi-ample.

PROOF. Let $n \geq 1$ be the minimum integer such that $N_{C/X}^n = \mathcal{O}_C$. By considering the exact sequence

$$H^0(X, \mathcal{O}_X(nC)) \rightarrow H^0(C, N_{C/X}^n) \rightarrow H^1(X, \mathcal{O}_X((n-1)C))$$

induced from $0 \rightarrow \mathcal{O}_X((n-1)C) \rightarrow \mathcal{O}_X(nC) \rightarrow \mathcal{O}_X(nC) \otimes \mathcal{O}_X/\mathcal{O}_X(-C) \rightarrow 0$, it is sufficient to show that $H^1(X, \mathcal{O}_X((n-1)C)) = 0$ holds. Note that $H^1(C, N_{C/X}^r) = 0$ holds for each $0 \leq r \leq n-1$ (It is clear for the case (1). For the case (2), we can prove it by using the same calculation as in the proof of Proposition 2.5). Thus we obtain $H^1(X, \mathcal{O}_X((n-1)C)) \cong H^1(X, \mathcal{O}_X)$ from the argument in [N, p. 38], which shows the lemma. $\square$

In the proof of Theorem 1.1 and Theorem 7.1, we use Theorem 1.4 in the following form:

COROLLARY 7.5. *Let X be a non-singular surface, $C \subset X$ be a reduced compact curve with only nodes such that each component of the normalization of C is a rational curve. Assume that the dual graph $G(C)$ is a cycle graph and that $N_{C/X} \in \mathcal{E}_1(C)$ holds. Then $\mathcal{O}_V(C)$ is a flat line bundle for some neighborhood V of C in X .*

PROOF. We obtain $H^1(C, \mathbb{C}(N_{C/X}^n)) = 0$ and $H^1(C, N_{C/X}^n) = 0$ hold for each n from Proposition 2.5 and the calculation as in the proof of it. Note that especially it holds that $u_n(C, X) = 0$ for each n . Thus we can apply Theorem 1.4, which shows the corollary. $\square$

In the proof of Theorem 7.1, it is also needed to treat a divisor D of a non-singular surface X which can be written in the form

$$D = aC + a_1E_1 + a_2E_2 + \cdots + a_NE_N \quad (a, a_1, a_2, \dots, a_N > 0),$$

where $C, E_1, E_2, \dots, E_N$ are non-singular compact curves embedded in X which satisfy the following conditions:

- There exists N points $p_1, p_2, \dots, p_N \in C$ different from each other such that, for each $\nu = 1, 2, \dots, N$, C intersects E_ν at p_ν transversally.
- $E_\nu \cap E_\mu = \emptyset$ holds for each $\nu \neq \mu \in \{1, 2, \dots, N\}$.
- The line bundle $N_{D/S} := \mathcal{O}_S(D)|_{\text{Supp } D}$ is topologically trivial, where $\text{Supp } D = C \cup E_1 \cup E_2 \cup \dots \cup E_N$.
- The greatest common divisor of $(a, a_1, a_2, \dots, a_N)$ is equal to 1.

Denote b the integer $-(C^2)$ and by b_ν the integer $-(E_\nu^2)$ for each $\nu = 1, 2, \dots, N$. Then it is clear from $(D^2) = 0$ that $b = (a_1 + a_2 + \dots + a_N)/a$ and $b_\nu = a/a_\nu$ hold ($\nu = 1, 2, \dots, N$). Fix a connected open neighborhood W of $\text{Supp } D$ which is a deformation retract of $\text{Supp } D$.

LEMMA 7.6. *Let $(X, D), W$ be as above. Then there exists a holomorphic line bundle L on W such that $L^a = \mathcal{O}_W(\sum_{\nu=1}^N a_\nu E_\nu)$ holds.*

PROOF. Denote by L' the line bundle $\mathcal{O}_W(-C)$. By considering the isomorphism $H^2(\text{Supp } D, \mathbb{Z}) \cong H^2(W, \mathbb{Z})$, we obtain that $\mathcal{O}_W(D) = (L')^a \otimes \mathcal{O}_W(\sum_{\nu=1}^N a_\nu E_\nu)$ is topologically trivial. Thus there exists a topologically trivial line bundle N' on W such that $(N')^a = (L')^a \otimes \mathcal{O}_W(\sum_{\nu=1}^N a_\nu E_\nu)$. We can prove the lemma by letting $L := L' \otimes N'$. $\square$

In the following, we fix a line bundle L as in Lemma 7.6.

LEMMA 7.7. *Let $(X, D), W, L$ be as above. Then there exists a connected non-singular complex surface $\widetilde{W}$ and a covering map $p: \widetilde{W} \rightarrow W$ with degree a which satisfies the following conditions:*

- (i) $p^{-1}(E_\nu)$ is the union of non-singular connected compact curves $\{\widetilde{E}_\nu^{(\lambda)}\}_{\lambda=1}^{a_\nu}$ for each ν .
- (ii) p is ramified along $\widetilde{E}_\nu^{(\lambda)}$ with ramification index b_ν for each ν and λ , and is unramified outside of them.
- (iii) $\mathcal{O}_W(\sum_{\nu=1}^N \sum_{\lambda=1}^{a_\nu} \widetilde{E}_\nu^{(\lambda)}) = p^* L$ holds.
- (iv) $\mathcal{O}_{\widetilde{W}}(\widetilde{D}) = p^* N'$ and $\mathcal{O}_{\widetilde{W}}(a\widetilde{D}) = p^* \mathcal{O}_W(D)$ hold, where N' is the line bundle appeared in the proof of Lemma 7.6 and

$$\widetilde{D} := p^{-1}(C) + \sum_{\nu=1}^N \sum_{\lambda=1}^{a_\nu} \widetilde{E}_\nu^{(\lambda)}.$$

PROOF. $p: \widetilde{W} \rightarrow W$ can be constructed as the normalization of the cyclic cover of W defined by the line bundle L . $\square$

For the above $(X, D), W$, we can show the following two propositions by applying [U83, Theorem 1, 2, 3] to the pair $(\widetilde{W}, \widetilde{D})$ as in Lemma 7.7 (We here remark that the idea to apply Ueda theory on a finite cover is pointed out by Prof. Tetsuo Ueda).

PROPOSITION 7.8. *Let $(X, D), W, L$ be as above. Assume that each E_ν is a rational curve, $N_{D/W} = \mathcal{O}_{\text{Supp } D}$ holds, and that the pair $(\widetilde{W}, \widetilde{D})$ is of infinite type. Then, after shrinking W if necessary, $\mathcal{O}_W(D)$ is a flat line bundle.*

PROOF. Note that each $\widetilde{E}_\nu^{(\lambda)}$ is a (-1) -curve. Thus there exists a contraction $\bar{p}: \widetilde{W} \rightarrow \overline{W}$ of each $\widetilde{E}_\nu^{(\lambda)}$. Denote by $\overline{C}$ the strict transform of $p^{-1}(C)$. We can deduce from the same argument as in the proof of Proposition 2.5 that $H^1(\overline{C}, \mathcal{O}_{\overline{C}}) \cong H^1(\widetilde{D}, \mathcal{O}_{\widetilde{D}})$. Thus $\bar{p}^*u_n(\overline{C}, \overline{W}) = u_n(\widetilde{D}, \widetilde{W}) = 0$ implies that $u_n(\overline{C}, \overline{W}) = 0$. Since the pair $(\overline{W}, \overline{C})$ is of infinite type, we can apply [U83, Theorem 3] to show that $\mathcal{O}_{\overline{W}}(\overline{C})$ is a flat line bundle. As it follows that the line bundle $\mathcal{O}_{\widetilde{W}}(\widetilde{D})$ is also flat, we can take a nowhere vanishing section $F \in H^0(\widetilde{W}, p^*N^{-1} \otimes \mathcal{O}_{\widetilde{W}}(\widetilde{D}))$, where N is a flat line bundle on W such that $N|_{\text{Supp } D} = N_{D/W}$ holds. Consider the section

$$F \otimes i^* F \otimes (i^2)^* F \otimes \dots (i^{a-1})^* F \in H^0(\widetilde{W}, p^*N^{-a} \otimes \mathcal{O}_{\widetilde{W}}(a\widetilde{D})) = H^0(\widetilde{W}, p^*(N^{-1} \otimes \mathcal{O}_W(D))),$$

where i is a generator of the group $\text{Aut}(\widetilde{W}/W)$ of all deck transformation of p . As it clearly holds that the section above is nowhere vanishing and $\text{Aut}(\widetilde{W}/W)$ -invariant, it can be realized as the pull-back of a nowhere vanishing holomorphic global section of the line bundle $N^{-1} \otimes \mathcal{O}_W(D)$, which induces the isomorphism $N \cong \mathcal{O}_W(D)$. $\square$

PROPOSITION 7.9. *Let $(X, D), W, L$ be as above. Assume that each E_ν is a rational curve, $N_{D/W} = \mathcal{O}_{\text{Supp } D}$, and that the pair $(\widetilde{W}, \widetilde{D})$ is of type $n < \infty$. Then the following holds:*

- (i) *For each real number $\lambda > 1$, There exists a neighborhood V of $\text{Supp } D$ and a strongly psh function $\Phi_\lambda: V \setminus \text{Supp } D \rightarrow \mathbb{R}$ such that $\Phi_\lambda(p) \rightarrow \infty$ and $\Phi_\lambda(p) = O(d(p, \text{Supp } D)^{-\lambda n/a})$ hold as $p \rightarrow \text{Supp } D$, where $d(p, \text{Supp } D)$ is the distance from p to $\text{Supp } D$ calculated by using a local Euclidean metric on a neighborhood of a point of C in V .*
- (ii) *Let V be a neighborhood of $\text{Supp } D$ in X , Ψ be a psh function defined on $V \setminus \text{Supp } D$. If there exists a real number $0 < \lambda < 1$ such that $\Psi(p) = O(d(p, \text{Supp } D)^{-\lambda n/a})$ as $p \rightarrow \text{Supp } D$, then there exists a neighborhood V_0 of $\text{Supp } D$ in V such that $\Psi|_{V_0 \setminus \text{Supp } D}$ is a constant function.*

PROOF. Let $\bar{p}: \widetilde{W} \rightarrow \overline{W}$ and $\overline{C}$ be those in the proof of Proposition 7.8. In this case, we can deduce that the pair $(\overline{W}, \overline{C})$ is of type $n < \infty$ by the same argument. Thus we can apply [U83, Theorem 1] to show that, for each $\lambda > 1$, by shrinking $\overline{W}$ if necessary, there exists a strongly psh function Φ' on $\overline{W} \setminus \overline{C}$ with $\Phi'(p) = O(|f_{\overline{C}}(p)|^{-\alpha})$ as $p \rightarrow \overline{C}$, where $f_{\overline{C}}$ is a local defining function of $\overline{C}$. Then the function $\sum_{\ell=1}^a (i^\ell)^*(\bar{p}^*\Phi')$ can be realized as a pull-back of a strongly psh function Φ by p , where i is a generator of $\text{Aut}(\widetilde{W}/W)$. The assertion (i) can be proved by considering this Φ . The assertion (ii) followed from the same argument as in the proof of [U83, Theorem 2] for the functions Φ and $p^*\Psi$. $\square$

7.3. Proof of Theorem 1.1. In this subsection, we prove Theorem 1.1.

When $N_{C/X} \in \mathcal{E}_1(C)$ holds, it follows from Corollary 7.5 that there exists a neighborhood V of C such that $\mathcal{O}_V(C)$ is flat. Thus, by the argument as in [K1, Corollary 3.5], we can show that Theorem 1.1 (i) holds. When $N_{C/X} \notin \mathcal{P}_0(C)$, we can use 1.6 and run the same argument as in the proof of [K2, Theorem 1.1], which proves Theorem 1.1 (ii). $\square$

7.4. Proof of Theorem 7.1. In this subsection, we prove Theorem 7.1. Let $p_1, p_2, \dots, p_9 \in \mathbb{P}^2$ be 9 points different from each other and denote by $\pi: X \rightarrow \mathbb{P}^2$ the blow-up at $\{p_j\}_{j=1}^9$. Take a curve $C_0 \subset \mathbb{P}^2$ of degree 3 which includes $\{p_j\}_{j=1}^9$ as elements.

PROPOSITION 7.10.

(i) *If K_X^{-1} is not nef, the positive part of K_X^{-1} is semi-ample.*
(ii) *If K_X^{-1} is nef, C_0 can be taken as a curve with $\{p_j\}_{j=1}^9 \cap C_{\text{sing}} = \emptyset$ and satisfying one of the following seven conditions:*

- (7.10.1): C_0 is a non-singular elliptic curve.
- (7.10.2): C_0 is a rational curve with a node.
- (7.10.3): C_0 is a rational curve with a cusp.
- (7.10.4): C_0 has only nodes, and it has two irreducible components: ℓ_0 with degree 1 and ℓ_1 with degree 2. It also hold that $\#(\{p_j\}_{j=1}^9 \cap \ell_0) = 3$ and that $\#(\{p_j\}_{j=1}^9 \cap \ell_1) = 6$.
- (7.10.5): C_0 has two irreducible components: ℓ_0 with degree 1 and ℓ_1 with degree 2. It also hold that $\#(\ell_0 \cap \ell_1) = 1$, $\#(\{p_j\}_{j=1}^9 \cap \ell_0) = 3$, and that $\#(\{p_j\}_{j=1}^9 \cap \ell_1) = 6$.
- (7.10.6): C_0 has only nodes, and it has three irreducible components ℓ_0, ℓ_1, ℓ_2 with degree 1. It also holds that $\#(\{p_j\}_{j=1}^9 \cap \ell_j) = 3$ for each $j = 0, 1, 2$.
- (7.10.7): C_0 has three irreducible components ℓ_0, ℓ_1, ℓ_2 with degree 1. It also hold that $\#(\ell_0 \cap \ell_1 \cap \ell_2) = 1$ and that $\#(\{p_j\}_{j=1}^9 \cap \ell_j) = 3$ for each $j = 0, 1, 2$.

PROOF. First we show the assertion (i). Let P be the nef part of Zariski decomposition of K_X^{-1} and denote by N the negative part: $K_X^{-1} = P \otimes \mathcal{O}_X(N)$. When K_X^{-1} is not nef, then $(K_X^{-1}.P) = -((P+N).N) = -(N^2) > 0$ holds. Thus we can apply [LT, Lemma 3.1] and conclude that P is semi-ample. (ii) can be shown by elemental arguments can be shown by case-by-case argument. $\square$

It follows from the above proposition that, in order to prove Theorem 7.1, it is sufficient to show one of the assertions (i), (ii), $\dots$, (iv) holds by assuming each condition (7.10.1), (7.10.2), $\dots$ (7.10.7) in Proposition 7.10 (ii). In the following, we denote by C the strict transform of C_0 .

7.4.1. case (7.10.1). In this case, the pair (C, X) is of infinite (see [N, Lemma 6.2]). Thus we can apply [U83, Theorem 3] to show that the assertion (i), (ii), or (iv) in Theorem 7.1 holds (see [Br]).

7.4.2. case (7.10.2). When $N_{C/X} \notin \mathcal{P}_0(C)$, we can use Theorem 1.1 (ii) to show the assertion Theorem 7.1 (iii) holds. Thus all we have to do is to consider the case when $N_{C/X} \in \mathcal{P}_0(C)$. If $N_{C/X} \in \mathcal{E}_0(C)$ holds, it follows from Lemma 7.4 that the assertion Theorem 7.1 (i) holds. If $N_{C/X} \in \mathcal{E}_1(C)$ holds, we can apply Theorem 1.1 (i) and show that the assertion Theorem 7.1 (ii) holds. The rest case is Theorem 7.1 (iv).

7.4.3. *case (7.10.3).* Let us denote by q the cuspidal point of C . Let $\pi_1: S_1 \rightarrow X$ be the blow-up at q , $\pi_2: S_2 \rightarrow S_1$ the blow-up at the singular point, and $\pi_3: S \rightarrow S_2$ the blow-up at the singular point. Denote by π the map $\pi_3 \circ \pi_2 \circ \pi_1: S \rightarrow S_0$. Let us denote by $C_1 \subset S$ the strict transform of the exceptional curve of π_3 , by $E_1 \subset S$ the strict transform of the exceptional curve of π_2 , by E_2 the strict transform of the exceptional curve of π_1 , and by $E_3 \subset S$ the strict transform of C_0 . Then the divisor $D := \pi^*C$ can be decomposed as $D = 6C_1 + 3E_1 + 2E_2 + E_3$.

Consider $p: \widetilde{W} \rightarrow S$ and $\widetilde{D}$ as in Lemma 7.7. By a calculation as in Proposition 2.5, it follows that $H^1(\text{Supp } D, \mathcal{O}_{\text{Supp } D}) = 0$ and thus $\mathcal{P}(\text{Supp } D) = \{\mathcal{O}_{\text{Supp } D}\}$. Therefore it turns out that $N_{D/S} = \mathcal{O}_{\text{Supp } D}$. When the pair $(\widetilde{D}, \widetilde{W})$ is of infinite type, it follows from Proposition 7.8 that there exists a neighborhood W of $\text{Supp } D$ such that $\mathcal{O}_W(D) = \mathcal{O}_W$. Thus we obtain that $\dim H^0(C, \mathcal{O}_X(C)|_C) = 1$. Considering the exact sequence $H^0(X, \mathcal{O}_X(C)) \rightarrow H^0(C, \mathcal{O}_X(C)|_C) \rightarrow H^1(X, \mathcal{O}_X) = 0$ induced by $0 \rightarrow \mathcal{O}_X \rightarrow \mathcal{O}_X(C) \rightarrow \mathcal{O}_X(C) \otimes \mathcal{O}_X/\mathcal{O}_X(-C) \rightarrow 0$, we can conclude that the assertion Theorem 7.1 (i) holds in this case. When the pair $(\widetilde{D}, \widetilde{W})$ is of finite type, we can use Proposition 7.9 and run the argument as in the proof of [K2, Theorem 1.1] to conclude that the assertion Theorem 7.1 (iii) holds.

7.4.4. *case (7.10.4).* In this case, we can show Theorem 7.1 by the same argument as case (7.10.2).

7.4.5. *case (7.10.5).* In this case, we can show Theorem 7.1 by the same argument as case (7.10.3).

7.4.6. *case (7.10.6).* In this case, we can show Theorem 7.1 by the same argument as case (7.10.2).

7.4.7. *case (7.10.7).* In this case, we can show Theorem 7.1 by the same argument as case (7.10.3). $\square$
